A Nd:YAG photocathode laser system is currently being assembled to service the BNL Accelerator Test Facility. The system utilizes a diode-pumped, actively mode-locked Nd:YAG oscillator as the seed for two lamp pumped amplifier stages and subsequent frequency quadruplying. This laser will simultaneously illuminate the metal cathode of a $1\frac{1}{2}$ cell S-band RF gun with a quantum efficiency of 1×10^{-4} at 266 nm, and provide 10 mJ of 1 μm light to control an optical semiconductor switch of the facility's CO_2 laser for laser particle acceleration experiments. Alternatively, pulse trains of up to 250 micropulses can be generated for FEL oscillator experiments. Up to 200 μJ at 266 nm in a single pulse are required for sufficient charge to be injected into the facility's 50 MeV linac and delivered to the various beamline experiments.

21950 (BNL–52435, pp. 89-96) **Diode-pumped lasers and amplifiers for photocathode illumination.** Gifford, M. (Lightwave Electronics Corp., Mountain View, CA (United States)); Steele, T. Brookhaven National Lab., Upton, NY (United States). [1994]. (CONF-9405276–: Lasers for RF guns, Anaheim, CA (United States), 14-15 May 1994). In *Lasers for RF guns: Proceedings.* 153p. Order Number DE95004856. Source: OSTI; NTIS; INIS; GPO Dep.

Characteristics of a commercial diode-pumped mode-locked oscillator are discussed, with emphasis on timing stabilization and phase noise. Laboratory results of diode-pumped multipass preamplifier that provides macropulse amplification of 30 dB are presented. Finally, performance of a diode-pumped regenerative amplifier and a power amplifier is discussed.

21951 (BNL–52435, pp. 97-108) **Picosecond laser source with single knob adjustable pulse width.** Scott, R.P. (Univ. of California, Los Angeles, CA (United States)); Bennett, C.V.; Kolner, B.H. Brookhaven National Lab., Upton, NY (United States). [1994]. (CONF-9405276–: Lasers for RF guns, Anaheim, CA (United States), 14-15 May 1994). In *Lasers for RF guns: Proceedings.* 153p. Order Number DE95004856. Source: OSTI; NTIS; INIS; GPO Dep.

The authors describe and demonstrate a system which can be used with many types of actively modelocked lasers to create a source of variable width picosecond pulses. This system is an active compression scheme which incorporates a resonant electro-optic quadratic phase modulator to impart the linear frequency chirp on an optical pulse. To demonstrate, they used the modulator

to chirp the 85 ps pulses from a modelocked Nd:YAG laser and subsequently compressed them with a dispersive delay line to less than 6 ps. It is possible with this system to smoothly vary the pulse width from the initial width to the fully compressed width by changing only the RF drive power going to the phase modulator.

21952 (BNL–52435, pp. 123-129) **Laser requirements for RF guns.** Yeremian, D. (SLAC, Stanford, CA (United States)). Brookhaven National Lab., Upton, NY (United States). [1994]. (CONF-9405276–: Lasers for RF guns, Anaheim, CA (United States), 14-15 May 1994). In *Lasers for RF guns: Proceedings.* 153p. Order Number DE95004856. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of this working group was to develop a chart showing the laser requirements for various RF Guns that are already completed or are being designed. The beam transport of all these guns predicate similar tolerances on the laser parameters. In addition, to optimize the quantum efficiency and minimize the emittance, capability to control the following parameters would also be desirable: polarization; spot size; energy; pointing; wavelength.

21953 (BNL–52435, pp. 131-146) **Report of the working group on laser systems.** Fisher, A.S. (Brookhaven National Lab., Upton, NY (United States)). Brookhaven National Lab., Upton, NY (United States). [1994]. (CONF-9405276–: Lasers for RF guns, Anaheim, CA (United States), 14-15 May 1994). In *Lasers for RF guns: Proceedings.* 153p. Order Number DE95004856. Source: OSTI; NTIS; INIS; GPO Dep.

The Working Group on Laser Systems considered the laser needs for several of the guns listed by the Working Group on RF-Gun Requirements. Designs were outlined to provide suitable beams, including requirements for stability and reproducible performance. One design, for the proposed LCLS (Linac Coherent Light Source) x-ray FEL at SLAC, was developed in greater detail. The LCLS design in particular incorporates the considerations of the Working Group on Practicalities.

21954 (BNL–52435, pp. 147-153) **A laser system for the TESLA photo-injector.** Will, I. (Max-Born-Institute for Nonlinear Optics and Short Pulse Spectroscopy, Berlin (Germany)); Sandner, W. Brookhaven National Lab., Upton, NY (United States). [1994]. (CONF-9405276–: Lasers for RF guns, Anaheim, CA (United States), 14-15 May 1994). In *Lasers for RF guns: Proceedings.* 153p. Order Number DE95004856. Source: OSTI; NTIS; INIS; GPO Dep.

A conceptual design for a solid-state laser system with output pulse parameters suitable to drive the photocathode of TESLA test facility is presented. General design considerations to overcome problems resulting from the unusual temporal pulse structure of the TESLA test facility are discussed.

21955 (BNL–61224) **Superconducting sextupoles and trim quadrupoles for RHIC.** Thompson, P. (and others); Anerella, M.; Ganetis, G. Brookhaven National Lab., Upton, NY (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–143: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011814. Source: OSTI; NTIS; INIS; GPO Dep.

RHIC requires 288 sextupole and 72 trim quadrupole magnets. These iron poletip superconducting magnets have been constructed by Everson Electric Co. Room temperature field measurements have been completed for 75% of these magnets with acceptable results. Approximately 15% of them have been tested at 4.6 K for maximum (quench) current. The quench performance for the early magnets was good and improved to excellent during the production run. These magnets have more than 100% margin at quench.

21956 (BNL–61226) **Field quality control through the production phase of RHIC arc dipoles.** Gupta, R. (and others); Jain, A.; Kahn, S. Brookhaven National Lab., Upton, NY (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–156: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011812. Source: OSTI; NTIS; GPO Dep.

The field quality in the arc dipoles built thus far for the Relativistic Heavy Ion Collider (RHIC) not only meets machine requirements but is significantly better than that expected from scaling laws based on previous large scale superconducting magnet production for particle accelerators. In this paper the authors describe the evolution of the present cross section and the design philosophy that has led to these improvements. The techniques described here have been found quite efficient to adopt in the production environment, where schedule and cost considerations become important. Moreover, the techniques developed during the R&D program have resulted in making the saturation induced harmonics negligible, despite the fact that the iron is very close to the coil.

21957 (BNL–61234) **Combined element magnet production for the relativistic heavy ion collider (RHIC) at BNL.** Mulhall, S. (and others); Foelsche, H.; Ganetis, G. Brookhaven National Lab., Upton, NY (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–155: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011811. Source: OSTI; NTIS; GPO Dep.

The production of 432 combined element magnets for RHIC is well underway. These magnets consist of a superconducting corrector, a quadrupole, and a sextupole combined into an integrated cold mass which is inserted into a cryostat. Production experiences as well as test results are reported.

21958 (BNL–61264) **Superconducting 8 CM Corrector magnets for the relativistic heavy ion collider (RHIC).** Morgillo, A. (and others); Escallier, J.; Ganetis, G. Brookhaven National Lab., Upton, NY (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–154: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011810. Source: OSTI; NTIS; GPO Dep.

RHIC will require 420 80 mm Corrector magnets. The magnets are made up of coils wound on a computer controlled wiring machine using ultrasonic power to bond the wire into an epoxy coated flat substrate. The coils are wrapped onto support tubes and concentrically assembled inside an iron yoke. These magnets are being built at Brookhaven National Laboratory (BNL) with more than 280 constructed by May 1, 1995. Design, construction and test results are presented.

21959 (BNL–61847) **A low emittance lattice for the NSLS X-Ray Ring.** Safranek, J. Brookhaven National Lab., Upton, NY (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–183: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013250. Source: OSTI; NTIS; INIS; GPO Dep.

A new high-brightness lattice for the NSLS X-Ray Ring is presented. The horizontal emittance of the X-Ray Ring can be reduced by a factor of two to three by allowing nonzero dispersion in the insertion device straight sections and by better controlling the periodicity of the dispersion. Beam was stored in a low emittance lattice during machine studies. The dispersion in the operations lattice lacks the 8-fold periodicity of the magnet structure, because the orbit is offset in the sextupoles. During machine studies the focusing effect of the sextupoles was compensated using trim supplies on the quadrupoles in the dispersive straight sections. Measured results will be presented. A discussion of the hardware upgrade requirements that would be necessary to run the low emittance lattice in operations is also included.

21960 (BNL–61878) **Small-gap undulator experiment on the NSLS X-ray Ring.** Stefan, P.M.; Krinsky, S.; Rakowsky, G.; Solomon, L. Brookhaven National Lab., Upton, NY (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950512–210: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013316. Source: OSTI; NTIS; INIS; GPO Dep.

We report results of an on-going experiment being carried out in the X13 straight section of the NSLS X-ray Ring which explores the limits of the operation of small-gap undulators. In particular, we discuss measurements of stored electron beam lifetime as a function of the vertical aperture presented by a 4-jaw scraper or a variable-aperture vacuum vessel. At an electron beam current of

300 mA the variable-aperture vacuum chamber was closed to an inner aperture of 3.8 mm with no effect on the electron beam lifetime. Measurements of the output radiation spectrum of a 16 mm period undulator at a magnet gap of 7.5 mm are also described.

21961 (CEA-CONF–11883) **Superconducting magnets for particle large accelerators.** Kircher, F. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Astrophysique, de la Physique des Particules, de la Physique Nucleaire et de l'Instrumentation Associee. 1994. 9p. (In French). (CONF-9403230– : 3. Technology Talks, Paris (France), 15-16 Mar 1994). Order Number DE95631318. Source: OSTI; NTIS (US Sales Only); INIS.

The different accelerator types (linear, circular) and the advantages of using superconductivity in particle accelerator are first reviewed. Characteristics of some large superconducting accelerators (Tevatron, HERA, RHIC, LHC CERN) are presented. The design features related to accelerator magnets are reviewed: magnet reproducibility, stability, field homogeneity, etc. and the selected design characteristics are discussed: manufacturing method, winding, shielding, cryostat. CEA involvement in this domain mainly addressing quadrupoles, is presented together with the Large Hadron Collider (LHC) project at CERN. Characteristics and design of detector magnets are also described. 5 figs., 2 tabs.

21962 (CEA-DAPNIA–94-25) **Final focus system with superconducting magnets in the interaction region of the TESLA linear collider.** Klein, E.; Napoly, O.; Rifflet, J.M. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Astrophysique, de la Physique des Particules, de la Physique Nucleaire et de l'Instrumentation Associee. Sep 1994. 3p. (CONF-9408125–: 17. international LINAC conference, Tsukuba (Japan), 21-26 Aug 1994). Order Number DE95632426. Source: OSTI; NTIS (US Sales Only); INIS.

The TESLA final focus system is presented for a center of mass energy of 500 GeV. The effects of magnet misalignment and field errors are analyzed for this system using the recently available program FFADA. A design for the last doublet superconducting quadrupoles, based on the LHC quadrupoles, is proposed. Tolerances to higher multipole components in the last doublet have been analyzed as well as the effect of the detector solenoid. (authors). 5 figs., 1 tab., 6 refs.

21963 (CEA-DAPNIA-SEA–94-03) **Measurements of current intensities from 10^{-18} A to 10^{-6} A emitted from niobium samples under high DC electric fields.** Boussoukaya, M.; Curtoni, A.; Zeitoun-Fakiris, A. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Astrophysique, de la Physique des Particules, de la Physique Nucleaire et de l'Instrumentation Associee. 1994. 4p. (CONF-9405116–: 16. international symposium on discharges and electrical insulation in vacuum: commercial applications and opportunities, Moscow (Russian Federation), 23-30 May 1994). Order Number DE95632469. Source: OSTI; NTIS (US Sales Only); INIS.

An experimental set-up allowing measurements of DC field emission currents in the range of 10^{-18} A to 10^{-6} A in ultra high vacuum ($P < 10^{-10}$ Torr) at room temperature has been developed. The detection of currents in the range of 10^{-18} A to 10^{-12} A was carried out with an electron multiplier located behind a grid anode. Higher currents were measured using a massive anode and a pico-ammeter. The whole system is designed to study niobium samples from sheets used to build electron superconducting accelerator cavities. Comparisons of the electron field emission from samples prepared by different surface treatments as chemical etching, electropolishing, oxide coating by anodization, are done. (authors). 5 figs., 4 refs.

21964 (CONF-9410294–5) **New resistor voltage grading system at the Oak Ridge National Laboratory 25URC tandem accelerator; installation and first experience.** Meigs, M.J.; Haynes, D.L.; Jones, C.M.; Juras, R.C. Oak Ridge National Lab., TN (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1994 symposium of the North Eastern Accelerator personnel (SNEAP-94); Kalamazoo, MI (United States); 12-15 Oct 1994. Order Number DE95008976. Source: OSTI; NTIS; GPO Dep.

On June 27,1994, installation work was completed on a new resistor-based voltage grading system for the Holifield facility tandem accelerator. This new system replaces the original point-plane corona-discharge system which had inherent disadvantages. Perhaps the worst disadvantages of corona-discharge systems are poor gap-to-gap voltage homogeneity and very low grading currents. It is believed that the resistor-based system will reduce or eliminate these disadvantages as well as some others.

21965 (FNAL/C–95/076-E) **Transition Radiation Detector in the D0 colliding beam experiment at Fermilab.** Piekarz, H. Florida State Univ., Tallahassee, FL (United States). Apr 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950276–3: 7. Vienna wire chamber conference (WCC-95), Vienna (Austria), 13-17 Feb 1995). Order Number DE95011837. Source: OSTI; NTIS; INIS; GPO Dep.

The construction, operation and response of the Transition Radiation Detector (TRD) at DO colliding beam experiment at Fermilab are presented. The use of the TRD signal to enhance electron identification and hadronic rejection in the multiparticle background characteristic for the antiproton-proton interactions at the center-of-mass energy of 1.8 TeV is also described and results are discussed.

21966 (FNAL/C–95/087) **MECAR (Main Ring Excitation Controller and Regulator): A real time learning regulator for the Fermilab Main Ring or the Main Injector synchrotron.** Flora, R.; Martin, K.; Moibenko, A.; Pfeffer, H.; Wolff, D.; Prieto, P.; Hays, S. Fermi National Accelerator Lab., Batavia, IL (United States). Apr 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950512–126: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011836. Source: OSTI; NTIS; INIS; GPO Dep.

The real time computer for controlling and regulating the FNAL Main Ring power supplies has been upgraded with a new learning control system. The learning time of the system has been reduced by an order of magnitude, mostly through the implementation of a 95 tap FIR filter in the learning algorithm. The magnet system consists of three buses, which must track each other during a ramp from 100 to 1700 amps at a 2.4 second repetition rate. This paper will present the system configuration and the tools used during development and testing.

21967 (FNAL/C–95/105) **Low-dispersion γ_t jump for the main injector.** Ng, K.Y.; Bogacz, A. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950512–203: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013236. Source: OSTI; NTIS; INIS; GPO Dep.

A bipolar γ_t-jump design is reported for the Fermilab Main Injector (Lattice MI-17). The total amount of jump is 1.3 units. Both the betatron and dispersion waves are confined, while the betatron tunes remain nearly unchanged. The Fermilab Main Injector has been designed to overcome some of the unfavorable effects on the particle motion around transition energy. Unlike the Main Ring, the Main Injector has a very large aperture, so that beam low due to scraping can be avoided. The bunch area at transition will be less than 0.1 eV-sec, so that the nonlinear Johnsen effect can be avoided. Also rapid ramping across transition is possible, so that the nonadiabatic time can be reduced. Nevertheless, negative-mass instability will develop when the bunch intensity is high enough. The only way to avoid this instability is to incorporate a γ_t jump.

21968 (FNAL/C–95/124) **Design of the MI40 beam-abort dump.** Bhat, C.M.; Martin, P.S.; Russell, A.D. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950512–212: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013247. Source: OSTI; NTIS; INIS; GPO Dep.

A beam-abort dump for the Fermilab Main Injector to handle 3E13 protons per pulse at 150 Gev has been designed. A 120 GeV beam line goes through the beam-dump off-set by 27cm from its center. The design and the environmental safety aspects of the beam-dump are described here.

21969 (FNAL/C–95/145) **The Fermilab Main Injector dipole and quadrupole cooling design and bus connections.** Satti, J.A. Fermi National Accelerator Lab., Batavia, IL (United States). Jun 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950512–216: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013586. Source: OSTI; NTIS; INIS; GPO Dep.

The proposed system for connecting the low conductivity water (LCW) and the electrical power to the magnets is explained. This system requires minimum maintenance. Stainless steel headers supply LCW to local, secondary manifolds which regulate the flow to the dipole and to the copper bus which conduct both power and cooling water to the quadrupole. A combination of ceramic feedthroughs and thermoplastic hoses insulate the piping electrically from the copper bus system. The utilities for the Main Injector are grouped together at the outside wall of the tunnel leaving most of the enclosure space for servicing. Space above the headers is available for future accelerator expansion. The new dipoles have bolted electrical connections with flexible copper jumpers. Separate compression fittings are used for the water connections. Each dipole magnet has two water circuits in parallel designed to minimize thermal stresses and the number of insulators. Two electrical insulators are used in series because this design has been shown to minimize electrolyses problems and copper ion deposits inside the insulators. The design value of the temperature gradient of the LCW is 8°C.

21970 (INIS-RU–405, pp. 387-390) **Saturne II polarized target.** Ball, J. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics.* Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

The proton polarized target system facility used at synchrotron Saturne II is Saclay for nucleon-nucleon elastic scattering studies is described. The proton target is made of 1.5 mm diameter glassy beads of pentanol doped with EHBA-CrV complex. 4 refs.; 3 figs.

21971 (INIS-RU–405, pp. 391-394) **The hydrogen and deuterium atomic beam polarized source as an internal target for NEPTUN experiment.** Ershov, V.P. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Fimushkin, V.V.; Kiselev, K.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics.* Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

Two polarized jet targets for obtaining a polarized hydrogen jet and deuterium one, proposed for the experiment NEPTUN at the accelerating and storage complex UNK, are described. The magnetic structure of the polarized jet target and the vacuum system of the main accelerator ring ion guide at the target area are shown. 4 refs.; 4 figs.

21972 (INIS-RU–405, pp. 395-404) **Ultracold source prototype for polarized atomic hydrogen beam (ATOM-H).** Ershov, V.P. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Fimushkin, V.V.; Gai, G.I. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics.* Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

Experimental investigations to get high-intensity neutral or polarized charged particle beam without microwave technique using ultracold microwave technique using ultracold source prototype of polarized atomic hydrogen beam ATOM-H are described. The pulse hydrogen beam with intensity of $Sx10^{14}$ atom/pulse is detected. 3 refs.; 8 figs.

21973 (INIS-RU–405, pp. 409-412) **Status of the Kharkov linac polarized electron source.** Agranovich, V.L. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Glamazdin, A.V.; Gorbenko, V.G. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics.* Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

The description of the GaAs polarized electron source - the Kharkov linac injection prototype. The design goals of the source are summarized. Preliminary results of the source performance testing are presented. The injector energy is 70 keV, beam intensity is 50 μA. Preliminary results of the source performance testing are presented. 3 refs.

21974 (INIS-RU–405, pp. 438-446) **On new possibilities of polarization experiments in proton beams.** Maisheev, V.A.; Mikhalev, V.L.; Frolov, A.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (In Russian). (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics.* Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

Possibilities of polarized proton and antiproton beams production from $\sigma^+\sigma^+$ hyperon decays, measurements of total cross sections of hadron interactions in a pure-spin states, observation of polarization of protons deflected with a bent monocrystals are considered. 4 refs.

21975 (INIS-RU–405, pp. 451-455) **Snake for POLEX.** Ufimtsev, A.G. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics.* Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

The snake magnet system for POLEX is described. The snake comprises 12 dipole magnets. The total length of the snake is 30 m, the length of a dipole magnet is 2 m. The snake provides for 3 orthogonal directions of polarization. 6 refs.

21976 (LA-UR–95-1210) **Test results for a heat-treated 4-cell 805 MHz superconducting cavity.** Rusnak, B.; Shapiro, A.H. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–92: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95010934. Source: OSTI; NTIS; INIS; GPO Dep.

Assessing superconducting technology for potential upgrades to existing proton accelerators as well as applications to future high-current machines necessitates developing expertise in the processing and handling of multicell cavities at useful frequencies. In order to address some of these technological issues, Los Alamos has purchased a 4-cell 805-MHz superconducting cavity from Siemens AG. The individual cavity cells were double-sided titanium heat-treated after equatorial welding, then the irises were welded to complete the cavity assembly. The resulting high RRR (residual resistance ratio) in the cells enables stable operation at higher cavity field levels than are possible with lower RRR material. Additionally, the high thermal conductivity of the material is conducive to rf and high peak power processing. The cavity was also cleaned at Los Alamos with high-pressure water rinsing. Results from the initial cavity tests, utilizing various processing techniques, are presented.

21977 (LA-UR–95-1450) **Advanced electromagnetic design of cavities for high current accelerators.** Krawczyk, F.L. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–103: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011999. Source: OSTI; NTIS; GPO Dep.

For high-current accelerators such as those proposed for transmutation technologies or spallation sources, preconstruction numerical modeling has a high importance. Non axisymmetric cavities require a full 3-D modeling. A complex analysis of structures beyond tuning and the calculation of Q and shunt impedance is required and also the interaction with the mechanical properties of the structures has to be taken into account. This paper reports on

recent work done at LANL for proposed beam funnels, a new normal-conducting medium-energy structure (CCDTL) and superconducting cavities for medium energy. The electromagnetic calculations have been done with MAFIA, Rel 3.2, the thermal and stress analysis results reported come from the ABAQUS engineering code.

21978 (LA-UR–95-1501) **Characterization of beam position monitors for measurement of second moment.** Russell, S.J.; Gilpatrick, J.D.; Power, J.F.; Shurter, R.B. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–106: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011991. Source: OSTI; NTIS; INIS; GPO Dep.

A dual-axis beam position monitor (BPM) consists of four electrodes placed at 90° intervals around the probe aperture. The response signals of these lobes can be expressed as a sum of moments. The first order moment gives the centroid of the beam. The second order moment contains information about the rms size of the beam. It has been shown previously that the second order moment can be used to determine beam emittance. To make this measurement, the authors must characterize the BPM appropriately. The approach to this problem is to use a pulsed wire test fixture. By using the principle of superposition, they can build up a diffuse beam by taking the signals from different wire positions and summing them. This is done two ways: first by physically moving a wire about the aperture and building individual distributions, and, second, by taking a two dimensional grid of wire positions versus signal and using a computer to interpolate between the grid points to get arbitrary wire positions and, therefore, distributions. The authors present the current results of this effort.

21979 (LA-UR–95-1506) **Lifetime test on a high-performance dc microwave proton source.** Sherman, J.D.; Hodgkins, D.J.; Lara, P.D.; Schneider, J.D.; Stevens, R.R. Jr. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–108: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011989. Source: OSTI; NTIS; INIS; GPO Dep.

Powerful CW proton linear accelerators (100 mA at 0.5–1 GeV) are being proposed for spallation neutron source applications.These production accelerators require high availability and reliability. A microwave proton source, which has already demonstrated several key beam requirements, was operated for one week (170 hours) in a dc mode to test the reliability and lifetime of its plasma generator. The source was operated with 570 W of microwave (2.45 GHz) discharge power and with a 47-kV extraction voltage. This choice of operating parameters gave a proton current density of 250-mA/cm^2 at 83% proton fraction, which is sufficient for a conservative dc injector design. The beam current was 60–65 mA over most of the week, and was sufficiently focused for RFQ injection. Total beam availability, defined as 47-keV beam-on time divided by elapsed time, was 96.2%. Spark downs in the high voltage column and a gas flow control problem caused all the downtime; no plasma generator failures were observed.

21980 (LA-UR–95-1548) **Ion-chamber-based loss monitor system for the Los Alamos Meson Physics Facility.** Plum, M.A.; Brown, D.; Browman, A.; Macek, R.J. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–148: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011978. Source: OSTI; NTIS; INIS; GPO Dep.

A new loss monitor system has been designed and installed at the Los Alamos Meson Physics Facility (LAMPF). The detectors are ion chambers filled with N_2 gas. The electronics modules have a threshold range of 1:100, and they can resolve changes in beam loss of about 2% of the threshold settings. They can generate a trip signal in 2 μs if the beam loss is large enough; if the response time of the Fast Protect System is included the beam will be shut off in about 37 μs.

21981 (LA-UR–95-1553) **A low-frequency high-voltage rf-barrier-bunching system for high-intensity neutron source compressor rings.** Hardek, T.W.; Ziomek, C.; Rees, D. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–149: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011976. Source: OSTI; NTIS; INIS; GPO Dep.

A Los Alamos design for a 1-MW pulsed neutron source incorporates a ring utilizing an rf-barrier bunching system. This bunching concept allows uniform longitudinal beam distributions with low momentum spread. Bunching cavities are operated at the revolution frequency (1.5 MHz in this case) and each of the 2nd, 3rd, 4th, and 5th revolution frequency harmonics. Their effects combine to maintain a beam free gap in the longitudinal distribution of the accumulated beam. The cavities are driven by low-plate-resistance common-cathode configured retrode amplifiers incorporating local rf feedback. Additional adaptive feed-forward hardware is included to reduce the beam-induced bunching-gap voltages well below that achievable solely with rf feedback. Details of this system are presented along with a discussion of the various feed-back and feed-forward techniques incorporated.

21982 (LBL–35419) **Fabrication and component testing results for a Nb_3Sn dipole magnet.** Dell'Orco, D.; Scanlan, R.M.; Taylor, C.E.; Lietzke, A.; Caspi, S.; van Oort, J.M.; McInturff, A.D. Lawrence Berkeley Lab., CA (United States). Oct 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (SC-MAG–455; CONF-941013–47: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95012379. Source: OSTI; NTIS; INIS; GPO Dep.

At present, the maximum field achieved in accelerator R&D dipoles is slightly over 10T, with NbTi conductor at 1.8 K. Although Nb_3Sn has the potential to achieve much higher fields, none of the previous dipoles constructed from Nb_3Sn have broken the 10T barrier. We report here on the construction of a dipole with high current density Nb_3Sn with a predicted short sample limit of 13T. A wind and react technique, followed by epoxy impregnation of the fiberglass insulated coils, was used. The problems identified with the use of Nb_3SD in earlier dipole magnets were investigated in a series of supplemental tests. This includes measurement of the degradation of J_c with transverse strain, cabling degradation, joint resistance measurements, and epoxy strength tests. In addition, coff assembly techniques were developed to ensure that adequate prestress could be applied without damaging the reacted Nb_3Sn cable. We report here the results of these tests and the construction status of this 50 mm bore dipole.

21983 (LBL–35423) **Design and fabrication of end spacers for a 13T Nb_3Sn dipole magnet.** Caspi, S.; Ghiorso, W.B.; Wandesforde, A. Lawrence Berkeley Lab., CA (United States). 17 Oct 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (SC-MAG–459; CONF-941013–44: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95012387. Source: OSTI; NTIS; INIS; GPO Dep.

A 13 Tesia R&D dipole magnet is currently being constructed using Nb_3Sn superconducting cable. The four-layer "cosine-theta" magnet uses a wide cable (~15 mm) that will undergo a 650 C reaction after each layer is wound. About 75 bronze spacers at the magnet "ends" separate the winding blocks in such a way that the stored strain energy in the cable is minimized and the integrated field harmonics are reduced. Wax prototypes of the designed spacers were made on a 5-axis milling machine. This method of rapid prototyping required no tooling and enabled us to produce a large number of different end spacers that can be physically inspected and repeatedly modified before final prototypes are made. Spacers were originally machined from wax billets which were later cast in bronze.

21984 (LBL–35425) **Design of a 16T Nb_3Sn twin dipole with a window-frame conductor layout.** van Oort, J.M.; Scanlan, R.M. Lawrence Berkeley Lab., CA (United States). 17 Oct 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (SC-MAG–461; CONF-941013–46:

Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95012383. Source: OSTI; NTIS; INIS; GPO Dep.

A simplified design study of a 16T Nb_3Sn twin bore accelerator dipole magnet is presented. The philosophy behind the study is to design a high field magnet with a coil structure optimized for a reasonable Lorentz-load and easy of construction. The coils are of the rectangular window-frame type with modular flat pancake windings, thus eliminating the need for complex coil return ends. The magnetic and structural design is presented and a comparison is made with existing coil layouts for high field magnets.

21985 (LBL–36055-Rev.) **Undulators for short wavelength FEL amplifiers.** Schlueter, R.D. Lawrence Berkeley Lab., CA (United States). Dec 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9408146–14-Rev.: 16. international free electron laser conference, Stanford, CA (United States), 21-26 Aug 1994). Order Number DE95012356. Source: OSTI; NTIS; GPO Dep.

Issues critical to the design of undulators for use in short wavelength FEL amplifiers, such as attainable on-axis field strength, device compactness, field quality, required magnetic gap, and strong focusing schemes, are discussed. The relative strength of various undulator technologies, including pure permanent magnet, hybrid, warm electromagnetic, pulsed, and superconducting electromagnetic devices in both helical and planar configurations are reviewed. Favored design options for proposed short wavelength FELs, such as the Linac Coherent Light Source at SLAC and the DUV Free-Electron Laser at BNL, are presented.

21986 (LBL–36306) **The SSC full cell prototype string test.** McInturff, A.D. (Lawrence Berkeley Lab., CA (United States)); Kraushaar, P.; Burgett, W.; Cromer, L. Lawrence Berkeley Lab., CA (United States); Superconducting Super Collider Lab., Dallas, TX (United States). 17 Oct 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098 ; AC35-89ER40486. (SC-MAG–480; CONF-941013–45: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95012384. Source: OSTI; NTIS; INIS; GPO Dep.

At the conclusion of the SSC half cell magnet string testing program in February, 1993, the preliminary data analysis revealed that several substantive technical questions remained unresolved. These questions were: (1) could the high voltages to ground (>2 kV) measured during fault (quench) conditions be substantially reduced, (2) could the number of magnetic elements that became resistive (quenched) be controlled and 3) did the cryostats of the magnetic elements provide adequate insulation and isolation to meet designed refrigeration loads. To address these and other existing questions, a prototypical fall cell of collider magnets (ten dipoles and two quadrupoles) was assembled and tested. At the conclusion of this testing there were definitive answers to most of the questions with numerical substantiation, the notable exception being the beat leak question. These answers and other results and issues are presented in this paper.

21987 (LBL–36350) **Design and performance of the ALS double-crystal monochromator.** Jones, G. (Lawrence Berkeley Lab., CA (United States)); Ryce, S.; Perera, R.C.C.; Lindle, D.W.; Karlin, B.A.; Woicik, J.C. Lawrence Berkeley Lab., CA (United States). Aug 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098 ; AC02-76CH00016. (CONF-940714–54: International meeting on synchrotron radiation instrumentation, Stony Brook, NY (United States), 18-22 Jul 1994). Order Number DE95012355. Source: OSTI; NTIS; GPO Dep.

A new "Cowan type" double-crystal monochromator, based on the boomerang design used at NSLS beamline X-24A, has been developed for beamline 9.3.1 at the ALS, a windowless UHV beamline covering the 1-6 keV photon-energy range. Beamline 9.3.1 is designed to simultaneously achieve the goals of high energy resolution, high flux, and high brightness at the sample. The mechanical design has been simplified, and recent developments in technology have been included. Measured mechanical precision of the monochromator shows significant improvement over existing designs. In tests with x-rays at NSLS beamline X-A, maximum deviations in the intensity of monochromatic light were just 7% during scans of several hundred eV in the vicinity of the Cr K edge (6 keV) with the monochromator operating without intensity feedback. Such precision is essential because of the high brightness of the ALS radiation and the overall length of beamline 9.3.1 (26 m).

21988 (LBL–36839) **Field errors in hybrid insertion devices.** Schlueter, R.D. Lawrence Berkeley Lab., CA (United States). Feb 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950261–4: Contribution for Halbach Festschrift, Berkeley, CA (United States), 3 Feb 1995). Order Number DE95012389. Source: OSTI; NTIS; INIS; GPO Dep.

Hybrid magnet theory as applied to the error analyses used in the design of Advanced Light Source (ALS) insertion devices is reviewed. Sources of field errors in hybrid insertion devices are discussed.

21989 (LBL–36844) **Research and development to complete construction of a setup for determination of the longitudinal profile and duration of ultrashort bunches. Final report.** Gazazian, E.D. (Yerevan Physics Inst., Erevan (Armenia)); Ivanian, M.I.; Laziev, E.M.; Avakian, R.A.; Mailian, A.E.; Oganessian, D.L.; Vardanian, A.O. Lawrence Berkeley Lab., CA (United States); Yerevan Physics Inst., Erevan (Armenia); Yerevan Research Inst. for Optical and Physical Measurement (Armenia). Mar 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95012442. Source: OSTI; NTIS; INIS; GPO Dep.

Here are presented the results of the authors investigations on the construction of a setup for determination of the longitudinal charge distribution function and duration of ultrashort electron bunches via the measurement of the time-profile of the bunch-generated optical transition radiation (OTR) burst. In the Theoretical Part of the Final Report are obtained conditions that determine the adequacy between the time-profile of OTR flash and bunch longitudinal charge distribution function with account of finiteness of the bunch cross-section and bandwidth of the receiver. The competing processes (bremsstrahlung, luminescence) as well as the boundary roughness effect are considered. The Experimental Part presents the justification for the choice of the target - an OTR-emitter, a description of the measurement scheme, and the main characteristics of the units the setup consists of. An account is given of the OTR simulator and of the setup calibration method. Demands are formulated both to the setup as a whole and to its units. Experimental results are given that confirm correctness of the chosen method. In the Appendix the authors consider alternative methods of solution of the problem posed.

21990 (LBL–36950) **The amplitude and phase control of the ALS Storage Ring RF System.** Lo, C.C.; Taylor, B.; Baptiste, K. Lawrence Berkeley Lab., CA (United States). Mar 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950512–110: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95012333. Source: OSTI; NTIS; INIS; GPO Dep.

A 500MHz, 300KW Klystron power amplifier provides RF power to the ALS Storage Ring. In order to accommodate the amplitude and phase changes during beam stacking and decay, which demand continuously varying power levels from the Klystron, four loops are used to keep the system operating properly, with two of those loops dedicated to keeping the two cavity tuners on tune. Description of the control loops and their performance data will be given. Using the modulation anode of the Klystron in the amplitude loop will be discussed.

21991 (SCL–592) **Nitrogen system for the SSC.** McAshan, M.; Thirumaleshwar, M.; Abramovich, S.; Ganni, V. Superconducting Super Collider Lab., Dallas, TX (United States). Oct 1992. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011147. Source: OSTI; NTIS; INIS; GPO Dep.

The Superconducting Super Collider consists of two parallel magnet rings, each 87,120 m in circumference, constructed in a tunnel 25 m to 74 m below ground level. They are operated at a controlled low helium temperature in order to maintain the magnet windings

in the superconducting state. To obtain this condition, the magnet cryostat is designed with a high-quality insulation obtained by a high vacuum chamber, multilayer insulation, and thermal shields at nominal temperatures of 84 K and 20 K. Thermal radiation and the conduction heat load through the supports are intercepted and absorbed by the 84-K shield. Liquid nitrogen provides the refrigeration for these loads. The 84-K shield is anchored to two 63.5-mm stainless-steel tubes. One of the tubes, the "liquid line," serves as a conduit in the distribution system of liquid nitrogen. The other tube, the "vapor line," is used to collect the nitrogen vapor generated in the cooling process and to supply this vapor to,the helium refrigerators for precooling. The vapor line may also be used as a continuous cooler by injecting controlled amounts of liquid nitrogen. The nitrogen system consists of nitrogen supplies; ten nitrogen dewars for the collider and two for the High Energy Booster located on the ground at the main shaft entrances; liquid and vapor transfer lines through the shaft to connect the surface and the tunnel systems; and transfer lines to bypass warm equipment sections of the collider. The nitrogen system is expected to operate at steady state condition except for cooldown, warmup, and system repair, for which transients are expected. During normal operation and standby modes of the collider, temperature, pressure, and mass flow are expected to be constant in all circuits of the nitrogen system. The conceptual design requirements for various flow schemes and the engineering considerations are presented in this report.

21992 (SLAC-PUB–95-6787) **A bunch compressor for the Next Linear Collider.** Emma, P.; Raubenheimer, T.; Zimmermann, F. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jun 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–191: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014651. Source: OSTI; NTIS; INIS; GPO Dep.

A bunch compressor design for the Next Linear Collider (NLC) is described. The compressor reduces the bunch length by a factor of 40 in two stages. The first stage at 2 GeV consists of an rf section and a wiggler. The second stage at 10 GeV is formed by an arc, an rf section, and a chicane. The final bunch phase is insensitive to initial phase errors and to beam loading in the intermediate S-band pre-linac. Residual longitudinal aberrations of the system are partially compensated. The bunch compressor encompasses a solenoid spin-rotator system at 2 GeV that allows complete control over the spin orientation.

21993 (SLAC-PUB–95-6789) **A final focus system for the Next Linear Collider.** Zimmermann, F.; Brown, K.; Emma, P.; Helm, R.; Irwin, J.; Tenenbaum, P.; Wilson, P. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jun 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–194: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014653. Source: OSTI; NTIS; INIS; GPO Dep.

The final focus of the Next Linear Collider (NLC) demagnifies electron and positron beams of 250–750 GeV energy down to a transverse size of about 2.5 $\times$ 350 nm^2 at the interaction point (IP). The basic layout, momentum bandwidth, vibration tolerances, wakefield effects, and the tunability of the proposed final focus design are discussed. Also a perspective is given on the crab cavity and on effects of the solenoid field in the interaction region.

21994 (SLAC-PUB–95-6790) **Performance of the 1994/95 SLC final focus system.** Zimmermann, F. (and others); Barklow, T.; Ecklund, S. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jun 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–193: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014654. Source: OSTI; NTIS; INIS; GPO Dep.

A major upgrade to the SLC final focus was installed in 1994 to eliminate the dominant third-order aberration of the system, and thereby to reduce the vertical beam size at the IP by a factor of two. At low current, the optimal beam size of about 400 nm is now routinely established, and its sensitivity to orbit variations, to changes of emittance and energy spread, and to other beam parameters has been studied. For intensities above 3 $\times$ 10^{10} particles per bunch, tuning is more difficult due to increased fluctuations of energy, orbit, and emittances. Nonetheless, the expected beam size of about 600 nm has been observed. New procedures and diagnostics allow easier tuning and optimization of the final focus, and also a first measurement of the emittance increase in the arcs.

21995 (SLAC-PUB–95-6813) **Damping rate measurements in the SLC damping rings.** Simopoulos, C.; Holtzapple, R.L. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jun 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–189: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014503. Source: OSTI; NTIS; INIS; GPO Dep.

The transverse damping rates of the SLC electron and positron damping rings have been measured during the high current physics run at, I = 3.5 $\times$ 10^{10} particles per bunch. The measurements, done over a period of two months, show large fluctuations exceeding the statistical uncertainty of each measurement. The longitudinal damping rate of the positron damping was also measured.

21996 (SLAC-PUB–95-6826) **Compact X-band high power load using magnetic stainless steel.** Tantawi, S.G. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Vlieks, A.E. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–200: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013422. Source: OSTI; NTIS; INIS; GPO Dep.

We present design and experimental results of a high power X-band load. The load is formed as a disk-loaded waveguide structure using lossy, Type 430 stainless steel. The design parameters have been optimized using the recently developed mode-matching code MLEGO. The load has been designed for compactness while maintaining a band width greater than 300 MHz.

21997 (SLAC-PUB–95-6842) **Polarized electron sources.** Clendenin, J.E. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–190: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014504. Source: OSTI; NTIS; INIS; GPO Dep.

Polarized electron sources for high energy accelerators took a significant step forward with the introduction of a new laser-driven photocathode source for the SLC in 1992. With an electron beam polarization of >80% and with ~99% uptime during continuous operation, this source is a key factor in the success of the current SLC high-energy physics program. The SLC source performance is used to illustrate both the capabilities and the limitations of solid-state sources. The beam requirements for future colliders are similar to that of the SLC with the addition in most cases of multiple-bunch operation. A design for the next generation accelerator source that can improve the operational characteristics and at least minimize some of the inherent limitations of present sources is presented. Finally, the possibilities for producing highly polarized electron beams for high-duty-factor accelerators are discussed.

21998 (SLAC-PUB–95-6848) **A damping ring design for the SLAC Next Linear Collider.** Raubenheimer, T.O. (and others); Byrd, J.; Corlett, J. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515 ; AC03-76SF00098. (CONF-950512–192: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995; LBL–37345). Order Number DE95014505. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper, we describe the design of the main damping rings and the positron pre-damping ring for the SLAC Next Linear Collider, a future linear collider with a center-of-mass energy of 0.5 to 1.5 TeV. The rings will operate at an energy of 2 GeV with a maximum repetition rate of 180 Hz. The normalized extracted beam emittances are $\gamma\epsilon_x$ = 3 mm-mrad and $\gamma\epsilon_y$ = 0.03 mm-mrad. To provide the necessary damping, the rings must damp multiple trains of bunches. Thus, the beam current is large, roughly 1 A. We will

present the optical layout, magnet designs, and RF systems, along with the dynamic aperture and required alignment tolerances; collective effects will be discussed in another paper.

21999 (SLAC-PUB–95-6891) **Operating experience with high beam currents and transient beam loading in the SLC damping rings.** Minty, M.G.; Akre, R.; Krejcik, P.; Siemann, R.H. Stanford Linear Accelerator Center, Menlo Park, CA (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–98: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95012563. Source: OSTI; NTIS; INIS; GPO Dep.

During the 1994 SLC run the nominal operating intensity in the damping rings was raised from 3.5×10^{10} to greater than 4×10^{10} particles per bunch (ppb). Stricter regulation of rf system parameters was required to maintain stability of the rf system and particle beam. Improvements were made in the feedback loops which control the cavity amplitude and loading angles. Compensation for beam loading was also required to prevent klystron saturation during repetition rate changes. To minimize the effects of transient loading on the rf system, the gain of the direct rf feedback loop and the loading angles were optimized.

22000 (SLAC-PUB–95-6892) **Fast and reliable kicker magnets for the SLC damping rings.** Mattison, T.S.; Cassel, R.L.; Donaldson, A.R.; Gross, G. Stanford Linear Accelerator Center, Menlo Park, CA (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–101: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95012407. Source: OSTI; NTIS; INIS; GPO Dep.

The design, construction, and operation of a kicker magnet with superior electromagnetic performance and greatly improved radiation tolerance is described. A short flux return of high mu ferrite improves the field strength and linearity with current, and novel metallic field-confining structures minimize the inductance. An 8-cell structure with capacitance integrated into each cell makes the magnet a nearly perfect transmission line. The capacitor dielectric is 1 cm thick alumina-loaded epoxy, processed to eliminate air voids, and cast in a multiple step procedure developed to circumvent epoxy shrinkage. The magnet operates with pulses of up to 40 kV and 3.2 kA at 120 Hz, with magnet transit times of less than 35 nsec and field rise and fall times of less than 60 nsec.

22001 (SLAC-PUB–95-6909) **SLAC modulator availability and impact on SLC operation.** Donaldson, A.R.; Ashton, J.R. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–129: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013286. Source: OSTI; NTIS; INIS; GPO Dep.

In 1991, the Stanford Linear Collider (SLC) operated, with diverse accelerator systems, at 60% availability. In the more auspicious 1992 and 1993 runs availability improved to over 80%. For the 94/95 run, the availability was also about 80%. Ignoring the eclectic-accelerator, this discussion will assess the dependence of the SLC on the reliability and hence, availability, of 244 klystron modulator systems that provide power to the machine's bunched-particle beams. Klystron modulator availability must be 99% for the accelerator to function at the 75% level. Fortunately, an excess of modulator/klystrons provides some redundancy and, therefore, allows some freedom from the requirement that all 244 systems perform simultaneously. There are, however, 15 specific exceptions. They populate strategic positions at the injector, damping rings, and positron production area of the accelerator complex. These, systems-without-spares, directly influence overall accelerator availability. Their calculated availability as an ensemble is 90%, but by chance they have operated at up to 99%. Individually, a malfunction can bring an experimental program to a halt. The discussion includes a description of several improvements to increase future availability for the modulator system.

22002 (SLAC-PUB–95-6910) **High current high accuracy IGBT pulse generator.** Nesterov, V.V.; Donaldson, A.R. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–127: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013287. Source: OSTI; NTIS; INIS; GPO Dep.

A solid state pulse generator capable of delivering high current triangular or trapezoidal pulses into an inductive load has been developed at SLAC. Energy stored in a capacitor bank of the pulse generator is switched to the load through a pair of insulated gate bipolar transistors (IGBT). The circuit can then recover the remaining energy and transfer it back to the capacitor bank without reversing the capacitor voltage. A third IGBT device is employed to control the initial charge to the capacitor bank, a command charging technique, and to compensate for pulse to pulse power losses. The rack mounted pulse generator contains a 525 μF capacitor bank. It can deliver 500 A at 900V into inductive loads up to 3 mH. The current amplitude and discharge time are controlled to 0.02% accuracy by a precision controller through the SLAC central computer system. This pulse generator drives a series pair of extraction dipoles.

22003 (SSC–106) **Shielding calculations for multi-TeV hadron colliders.** Van Ginneken, A. (Fermi National Accelerator Lab., Batavia, IL (United States)); Yurista, P.; Yamaguchi, C. Fermi National Accelerator Lab., Batavia, IL (United States). Jan 1987. 213p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (FN–447). Order Number DE95011173. Source: OSTI; NTIS; GPO Dep.

The present volume is most easily described as an extension of an earlier similar effort. The extension is mainly to higher energies but it also includes colliding beam simulations as well as muon production and transport. There is also a larger variety of geometries presented. But the purpose remains the same: to provide a collection of graphs which may serve as a rough guide in shielding applications. Detailed designs seldom resemble the idealized cases analyzed here and deserve specific computation with particular attention to any suspected weak spots. The graphs included here are intended to go no further than to form a useful starting point in design work. Such an approach is already quite effective at 1 TeV and below and will become even more so at higher energies where shielding costs are even larger. The choice of standard energies (5, 10 and 20 TeV) reflects the range of collider energies presently contemplated and allows for modest extrapolation outside this range. For fixed target results up to 1 TeV refs. 1 and 2 may be consulted. As in refs. 1 and 2, all results in this volume (except those pertaining to "muon beams") use the Monte Carlo code CASIM. Where π° induced electromagnetic showers are included as, e.g., in muon production or in energy deposition, they are simulated with the AEGIS code. Predictions of CASIM (plus AEGIS where applicable) for target heating, induced radioactivity and absorbed dose in the sub-TeV regime agree quite well with experiment. Likewise CASIM results compare well with a set of absorbed dose measurements taken outside thick shields for a variety of beam loss and shielding geometries. The full extension of CASIM into the multi-TeV domain requires considerable modifications to both particle production and particle transport models. This extension is presently only partly completed.

22004 (SSC–124) **Criteria for the SSC helium refrigerator.** VanderArend, P. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1987. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011174. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the following criteria for the SSC helium refrigerator: Cryogenic system description; required services for the magnet system; transport of cryogenic fluids around the rings; steady state loads; magnet system cooldown; helium storage facility; refrigerator requirements after a quench; refrigerator capacity; refrigerator redundancy; future expandability; utilities; and description of refrigeration plant studied by the CDG.

22005 (SSCL–261) **Irradiation of fiber optics in the SSC tunnel.** Dickey, C.E. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1990. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011179. Source: OSTI; NTIS; INIS; GPO Dep.

The salient question is not whether optical fiber will survive in the Super Conducting Supercollider (SSC) tunnel, but rather how long will it survive. Current estimates indicate that single mode fiber under ideal conditions will have an expected lifetime of at least 25 years. Future development of optical fiber will lead to longer service lifetimes and increased radiation hardness. But conservatively speaking, current production optical fibers can probably not be depended upon for more than 25 years of service even under ideal conditions.

22006 (SSCL–271) **A dynamic model for helium core heat exchangers.** Schiesser, W.E. (Lehigh Univ., Bethlehem, PA (United States)); Shih, H.J.; Hartozog, D.G.; Herron, D.M.; Nahmias, D.; Stuber, W.G.; Hindmarsh, A.C. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1990. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-900348–26: 2. international industrialization symposium on the super collider (IISSC), Miami, FL (United States), 14-16 Mar 1990). Order Number DE95011225. Source: OSTI; NTIS; INIS; GPO Dep.

To meet the helium (He) requirements of the superconducting supercollider (SSC), the cryogenic plants must be able to respond to time-varying loads. Thus the design and simulation of the cryogenic plants requires dynamic models of their principal components, and in particular, the core heat exchangers. In this paper, we detail the derivation and computer implementation of a model for core heat exchangers consisting of three partial differential equations (PDES) for each fluid stream (the continuity, energy and momentum balances for the He), and one PDE for each parting sheet (the energy balance for the parting sheet metal); the PDEs have time and axial position along the exchanger as independent variables. The computer code can accommodate any number of fluid streams and parting sheets in an adiabatic group. Features of the code include: rigorous or approximate thermodynamic properties for He, upwind and downwind approximation of the PDE spatial derivatives, and sparse matrix time integration. The outputs from the code include the time-dependent axial profiles of the fluid He mass flux, density, pressure, temperature, internal energy and enthalpy. The code is written in transportable Fortran 77, and can therefore be executed on essentially any computer.

22007 (SSCL–274) **Bulk Modulus Capacitor Load Cells.** Dickey, C.E. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1990. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-900348–25: 2. international industrialization symposium on the super collider (IISSC), Miami, FL (United States), 14-16 Mar 1990). Order Number DE95011180. Source: OSTI; NTIS; INIS; GPO Dep.

Measurement of forces present at various locations within the SSC Model Dipole collared coil assembly is of great practical interest to development engineers. Of particular interest are the forces between coils at the parting plane and forces that exist between coils and pole pieces. It is also desired to observe these forces under the various conditions that a magnet will experience such as: during the collaring process, post-collaring, under the influence of cryogens, and during field excitation. A twenty eight thousandths of an inch thick capacitor load cell which utilizes the hydrostatic condition of a stressed plastic dielectric has been designed. These cells are currently being installed on SSC Model Dipoles. The theory, development, and application of these cells will be discussed.

22008 (SSCL–332) **The status of detectors at the SSC.** Stefanski, R. Superconducting Super Collider Lab., Dallas, TX (United States). Sep 1990. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-9009329–2: Workshop on physics at UNK, Protvino (USSR), 25-28 Sep 1990). Order Number DE95011229. Source: OSTI; NTIS; INIS; GPO Dep.

The announcement of the location of the SSC at the site near Waxahachie, Texas was made in January, 1989. Since then a great many important steps have been taken toward the start of the new Laboratory. Some 900 people have been brought to the site as the starting nucleus of the staff that will ultimate number about 2200. A design baseline has been completed that includes a conceptual design for the accelerator, and the detectors. Also, the process has begun to determine the configuration of detectors that will be built for the SSC. This process has several steps, and now the first of these has been taken: The detector collaborations have submitted the Expression of Interest to the Laboratory. These were reviewed by Laboratory management and the Physics Advisory Committee in July, 1990 and recommendations were made to the collaborations. Decisions were deferred for all of the detectors. But perhaps the most significant recommendation was the request to reduce the size and cost of the general purpose detectors. The detector collaborations are now reviewing their initial designs to prepare for the Letters of Intent, the next step in the detector planning process. This is clearly a difficult and crucial step in that the redesign of the detectors must be done with minimal reduction in detector quality. It is an interesting time in the development of the new laboratory, and a crucial time for the ultimate physics that will be done at the SSC.

22009 (SSCL–388) **A model for local current decay in a superconducting LR chain.** Garavaglia, T.; Kauffmann, K. Superconducting Super Collider Lab., Dallas, TX (United States). 1 Apr 1991. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011140. Source: OSTI; NTIS; INIS; GPO Dep.

Solutions are given for the decay of the local current in both a finite and an infinite superconducting circuit consisting of a linear array of loops each containing in series an inductance L and in parallel a resistance R. Numerical results obtained from these solutions are given, and the results for local current decay for both cases are compared The properties of polynomials associated with the finite chain solution and two generating functions along with the method of solution of the diffusion type equation associated with the infinite chain model are discussed in the appendices. These solutions are used to obtain insight into the nature of the time decay of the currents in the loops resulting from crossings of the strands forming the superconducting cable of the SSC dipole magnets.

22010 (SSCL–453) **Refrigeration plants for the SSCL.** McAshan, M.; Ganni, V.; Than, R.; Niehaus, T. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1991. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-910340–55: 3. annual international industrialization symposium on the super collider (IISSC), Atlanta, GA (United States), 13-15 Mar 1991). Order Number DE95011142. Source: OSTI; NTIS; INIS; GPO Dep.

The basic requirements and operating features of the collider cryogenic system have already been described in other publications. The general arrangement of the refrigeration plant and its subsystems is presented, and the issue of how to provide redundancy in the cryogenic system is addressed, and some of the basic features of the refrigeration plants are described. The collider cryogenic system design is not final yet, and this report only reflects the direction and current status of the cryogenic system design.

22011 (SSCL–627) **VxWorks v5.1 benchmark tests.** Botlo, M.; Jagielski, M.; Romero, A. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011149. Source: OSTI; NTIS; INIS; GPO Dep.

We measure the performance of the VxWorks Real-time Operating System on various VME single-board computers and compare VxWorks (v5.02) and VxWorks(v5.1).

22012 (SSCL–655) **A study of the HEB longitudinal dynamics.** Larson, D.J. Superconducting Super Collider Lab., Dallas, TX (United States). Dec 1993. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011185. Source: OSTI; NTIS; INIS; GPO Dep.

A study of the High Energy Booster (HEB) longitudinal dynamics is presented. Full derivations of ramp dependent longitudinal variables are given. The formulas assume that the input magnetic field and beam longitudinal emittance are known as a function of time, and that either the rf voltage or the rf bucket area are known as a function of time. Once these three inputs are specified, the formulas can be used to calculate values for all other longitudinal dynamics variables. The formulas have been incorporated into a single computer code named ELVIRA: Evaluation of Longitudinal Variables in Relativistic Accelerators. The ELVIRA code is documented here in detail. The ELVIRA code is used under two initial

longitudinal emittance assumptions to plot ramp functions for the longitudinal dynamics design of the HEB as of May 5, 1992.

22013 (SSCL–656) **Design of a synchrotron radiation detector for the test beam lines at the Superconducting Super Collider Laboratory.** Hutton, R.D. Superconducting Super Collider Lab., Dallas, TX (United States). Jan 1994. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011186. Source: OSTI; NTIS; INIS; GPO Dep.

As part of the particle- and momentum-tagging instrumentation required for the test beam lines of the Superconducting Super Collider (SSC), the synchrotron radiation detector (SRD) was designed to provide electron tagging at momentum above 75 GeV. In a parallel effort to the three test beam lines at the SSC, schedule demands required testing and calibration operations to be initiated at Fermilab. Synchrotron radiation detectors also were to be installed in the NM and MW beam lines at Femilab before the test beam lines at the SSC would become operational. The SRD is the last instrument in a series of three used in the SSC test beam fines. It follows a 20-m drift section of beam tube downstream of the last silicon strip detector. A bending dipole just in of the last silicon strip detector produces the synchrotron radiation that is detected in a 50-mm-square cross section NaI crystal. A secondary scintillator made of Bicron BC-400 plastic is used to discriminate whether it is synchrotron radiation or a stray particle that causes the triggering of the NaI crystal's photo multiplier tube (PMT).

22014 (SSCL–657) **A bipolar integrator for secondary emission profile monitors at the SSCL.** Datte, P.; Beechy, D.; Webber, R. Superconducting Super Collider Lab., Dallas, TX (United States). Jan 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011253. Source: OSTI; NTIS; INIS; GPO Dep.

Many invasive techniques for monitoring beam profile and intensity require secondary emission signals in order to make the measurement. Signal acquisition and processing can take many forms. This paper describes a bipolar integration technique which uses the Burr-Brown ACF2101 Dual Switched Integrator chip and applications for accelerator beam instrumentation.

22015 (SSCL–658) **Activation of the liquid helium contamination during its passage in the Collider ring.** Lopez, G. Superconducting Super Collider Lab., Dallas, TX (United States). Jan 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011254. Source: OSTI; NTIS; INIS; GPO Dep.

Radioactivation of possible contamination of the liquid helium trapped in the arcs of the Collider ring of the Superconducting Super Collider and transported by the liquid helium is estimated. This estimation is used to calculate the dose rate on the filter of the refrigerator plant located at the top of the shaft.

22016 (SSCL–669) **Injection system of teh SSC Medium Energy Booster.** Mao, N.; Gerig, R.; McGill, J.; Brown, K. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011187. Source: OSTI; NTIS; INIS; GPO Dep.

The Medium Energy Booster (MEB) is the third of the SSCL accelerators and the largest of the resistive magnet synchrotrons. It accelerates protons from an injection momentum of 12 GeV/c to a top momentum of 200 GeV/c. A beam injection system has been designed to inject the beam transferred from the Low Energy Booster onto the MEB closed orbit in the MEB injection insertion region. The beam is injected via a vertical bending Lambertson septum magnet and a horizontal kicker with appropriate matching and very little beam loss and emittance dilution. The beam optics of the injection system is described in this paper. The required parameters of the Lambertson septum magnet and the injection kicker are given.

22017 (SSCL–670) **Above-cutoff impedance measurements of pumping holes for the Collider Liner.** Walling, L.; Barts, T.; Ruiz, E.; Turner, W.; Spayd, N. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011188. Source: OSTI; NTIS; INIS; GPO Dep.

A holed liner was considered for the Superconducting Super Collider (SSC) Collider Ring because of vacuum problems caused by photon-induced desorption. The liner would serve to shield the cold surface of the beam tube from the synchrotron radiation and the holes (or slots) would allow distributed pumping by gas-absorption material that could be placed between the liner and the beam tube. The impedance of holes and slots in a liner were studied by means of simulations using both MAFIA and HFSS, analytical modelling, wire measurements and electron beam measurements.

22018 (SSCL-Preprint–31) **Muon systems.** Bensinger, J. Superconducting Super Collider Lab., Dallas, TX (United States). Oct 1991. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011039. Source: OSTI; NTIS; INIS; GPO Dep.

The designs of both the GEM and SDC muon systems an the technological choices are reviewed. In particular, the chamber options for the detectors are discussed.

22019 (SSCL-Preprint–37) **Quench propagation velocity for highly stabilized conductors.** Mints, R.G. (Tel Aviv Univ. (Israel)); Ogitsu, T.; Devred, A. Superconducting Super Collider Lab., Dallas, TX (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011040. Source: OSTI; NTIS; INIS; GPO Dep.

Quench propagation velocity in conductors having a large amount of stabilizer outside the multifilamentary area is considered. It is shown that the current redistribution process between the multifilamentary area and the stabilizer can strongly effect the quench propagation. A criterion is derived determining the conditions under which the current redistribution process becomes significant, and a model of effective stabilizer area is suggested to describe its influence on the quench propagation velocity. As an illustration, the model is applied to calculate the adiabatic quench propagation velocity for a conductor geometry with a multifilamentary area embedded inside the stabilizer.

22020 (SSCL-Preprint–107) **A method of lines solution of the transient behavior of the helium cooled power leads for the SSC.** Demko, J.A.; Schiesser, W.E.; Carcagno, R.; McAshan, M. Superconducting Super Collider Lab., Dallas, TX (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011117. Source: OSTI; NTIS; INIS; GPO Dep.

In this study, a detailed numerical thermal mode of a 6.5 kA power lead for the Superconducting Super Collider has been developed, which was adapted from the dynamic model developed by Schiesser. The transient behavior of the power leads was modeled using, a method of lines (MOL) approach. The model was developed to pmvide a tool for analyzing coolant control strategies as well as an understanding of the behavior of the leads under presumed system transients. Results for a current ramp up to 4970 amps are favorably compared with measurements. Also, a loss of cooling situation is predicted to determine the transient temperature distribution under an off-design condition.

22021 (SSCL-Preprint–121) **A method to quench and recharge avalanche photo diodes for use in high rate situations.** Regan, T.O. (Superconducting Super Collider Lab., Dallas, TX (United States)); Fenker, H.C.; Thomas, J.; Oliver, J. Superconducting Super Collider Lab., Dallas, TX (United States). Jun 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011050. Source: OSTI; NTIS; INIS; GPO Dep.

We present a new method of using Avalanche Photo Diodes (APDS) for low level light detection in Geiger mode in high rate situations such as those encountered at the Superconducting Super Collider (SSC). The new technique is readily adaptable to implementation in CMOS VLSI.

22022 (SSCL-Preprint–133) **Quench performance of 50-mm aperture, 15-m-long SSC dipole magnets built at Fermilab.**

Kuzminski, J. (and others); Bush, T.; Coombes, R. Superconducting Super Collider Lab., Dallas, TX (United States). Jul 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011101. Source: OSTI; NTIS; INIS; GPO Dep.

The quench performance, ramp rate dependence, and mechanical behavior of ten full-length, 50-mm-aperture, SSC dipole magnets built at Fermilab are discussed. Cold testing of these magnets shows that the quench plateau established at 4.35 K exceeds the design value by more than 10%, virtually without training.

22023 (SSCL-Preprint–162) **Full-power test of a string of magnets comprising a half-cell of the Superconducting Super Collider.** Burgett, W. (and others); Christianson, M.; Coombes, R. Superconducting Super Collider Lab., Dallas, TX (United States). Oct 1992. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011104. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper we describe the full-powered operation of a string of industrially-fabricated magnets comprising a half-cell of the Superconducting Super Collider (SSC). The completion of these tests marks the first successful operation of a major SSC subsystem. The five 15-m long dipole magnets in the string had an aperture of 50 mm and the single 5-m long quadrupole aperture was 40 mm. Power and cryogenic connections were made to the string through spool pieces that are prototypes for SSC operations. The string was cooled to cryogenic temperatures in early July, 1992, and power tests were performed at progressively higher currents up to the nominal SSC operating point above 6500 amperes achieved in mid-August. In this paper we report on the electrical and cryogenic performance of the string components and the quench protection system during these initial tests.

22024 (SSCL-Preprint–195-Rev.A) **Interaction between beam control and rf feedback loops for high Q cavities an heavy beam loading. Revision A.** Mestha, L.K. (Superconducting Super Collider Lab., Dallas, TX (United States)); Kwan, C.M.; Yeung, K.S. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1994. 68p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011112. Source: OSTI; NTIS; INIS; GPO Dep.

An open-loop state space model of all the major low-level rf feedback control loops is derived. The model has control and state variables for fast-cycling machines to apply modern multivariable feedback techniques. A condition is derived to know when exactly we can cross the boundaries between time-varying and time-invariant approaches for a fast-cycling machine like the Low Energy Booster (LEB). The conditions are dependent on the Q of the cavity and the rate at which the frequency changes with time. Apart from capturing the time-variant characteristics, the errors in the magnetic field are accounted in the model to study the effects on synchronization with the Medium Energy Booster (MEB). The control model is useful to study the effects on beam control due to heavy beam loading at high intensities, voltage transients just after injection especially due to time-varying voltages, instability thresholds created by the cavity tuning feedback system, cross coupling between feedback loops with and without direct rf feedback etc. As a special case we have shown that the model agrees with the well known Pedersen model derived for the CERN PS booster. As an application of the model we undertook a detailed study of the cross coupling between the loops by considering all of them at once for varying time, Q and beam intensities. A discussion of the method to identify the coupling is shown. At the end a summary of the identified loop interactions is presented.

22025 (SSCL-Preprint–250) **Measurement of complex surfaces.** Brown, G.M. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486 ; AC03-76SF00098. Order Number DE95011114. Source: OSTI; NTIS; INIS; GPO Dep.

Several of the components used in coil fabrication involve complex surfaces and dimensions that are not well suited to measurements using conventional dimensional measuring equipment. Some relatively simple techniques that are in use in the SSCL Magnet Systems Division (MSD) for incoming inspection will be described, with discussion of their suitability for specific applications. Components that are submitted for MSD Quality Assurance (QA) dimensional inspection may be divided into two distinct categories; the first category involves components for which there is an approved drawing and for which all nominal dimensions are known; the second category involves parts for which 'reverse engineering' is required, the part is available but there are no available drawings or dimensions. This second category typically occurs during development of coil end parts and coil turn filler parts where it is necessary to manually shape the part and then measure it to develop the information required to prepare a drawing for the part.

22026 (SSCL-Preprint–265) **The low energy booster project status.** Tuttle, G.W. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–112: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE95011116. Source: OSTI; NTIS; INIS; GPO Dep.

In order to achieve the required injection momentum, the Superconducting Super Collider (SSC) has an accelerator chain comprised of a Linear Accelerator and three synchrotrons. The Low Energy Booster (LEB) is the first synchrotron in this chain. The LEB project has made significant progress in the development of major subsystems and conventional construction. This paper briefly reviews the performance requirements of the LEB and describes significant achievements in each of the major subsystem areas. Highlighted among these achievements are the LEB foreign collaborations with the Budker Institute of Nuclear Physics (BINP) located in Novosibirsk, Russia.

22027 (SSCL-Preprint–267) **Corrector magnets: Combined structural analysis of collier 50 mm aperture ordered wound dipoles interior section.** Tran, Vu H. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–121: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE95011197. Source: OSTI; NTIS; INIS; GPO Dep.

The 50mm aperture prototype collider ordered wound dipole connector magnets have been modeled with finite element techniques considering the individual and combined load cases of the preloading from keys, cooldown to 4 K and the effect of magnetic forces during energizing. Results of the analysis are presented as longitudinal, transverse and shear stresses for the ordered wound coils and as maximum von Mises stress for the carbon steel outer laminations, the stainless steel inner lamination, and the carbon steel keys.

22028 (SSCL-Preprint–269) **Corrector magnets: Combined structural analysis of collider 50 mm aperture ordered wound quadrupoles interior section.** Tran, Vu H. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–113: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE95011118. Source: OSTI; NTIS; INIS; GPO Dep.

The 50mm aperture prototype collider ordered wound quadrupole corrector magnets have been modeled with finite element techniques considering the individual and combined load cases of the preloading from keys, cooldown to 4 K and the effect of magnetic forces during energizing. Results of the analysis are presented as longitudinal, transverse and shear stresses for the ordered wound coils and as maximum von Mises stress for the carbon steel outer laminations, the stainless steel inner lamination, and the carbon steel keys.

22029 (SSCL-Preprint–291) **A comparison of least squares linear regression and measurement error modeling of warm/cold multipole correlation in SSC prototype dipole magnets.** Pollock, D. (Superconducting Super Collider Lab., Dallas, TX

(United States)); Kim, K.; Gunst, R.; Schucany, W. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537--111: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE95011121. Source: OSTI; NTIS; INIS; GPO Dep.

Linear estimation of cold magnetic field quality based on warm multipole measurements is being considered as a quality control method for SSC production magnet acceptance. To investigate prediction uncertainties associated with such an approach, axial-scan (Z-scan) magnetic measurements from SSC Prototype Collider Dipole Magnets (CDM's) have been studied. This paper presents a preliminary evaluation of the explanatory ability of warm measurement multipole variation on the prediction of cold magnet multipoles. Two linear estimation methods are presented: least-squares regression, which uses the assumption of fixed independent variable (xi) observations, and the measurement error model, which includes measurement error in the xi's. The influence of warm multipole measurement errors on predicted cold magnet multipole averages is considered. MSD QA is studying warm/cold correlation to answer several magnet quality control questions. How well do warm measurements predict cold (2kA) multipoles? Does sampling error significantly influence estimates of the linear coefficients (slope, intercept and residual standard error)? Is estimation error for the predicted cold magnet average small compared to typical variation along the Z-Axis? What fraction of the multipole RMS tolerance is accounted for by individual magnet prediction uncertainty?

22030 (SSCL-Preprint–298) **Equipment acquisition plans for the SSCL magnet excitation power system.** Winje, R. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–114: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE95011119. Source: OSTI; NTIS; INIS; GPO Dep.

This report gives a brief description of the major electrical technical equipment used in the Superconducting Super Collider accelerators systems and the present laboratory plans for the acquisition of the equipment.

22031 (SSCL-Preprint–313) **Advances in the use of tomographic inspection techniques for non-destructive analysis of geometric conductor position and correlation with magnetic cross-section modeling.** Bein, D. (Superconducting Super Collider Lab., Dallas, TX (United States)); Snitchler, G.; Rabaey, G.F.; Bolger, J.; Crane, R. Morgan, I.L.; Vinson, M. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–115: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE95011120. Source: OSTI; NTIS; INIS; GPO Dep.

Industrial Computerized Tomography has been applied to magnet components in various stages of the manufacturing process. These Computerized Tomographic images can be analyzed to infer detailed dimensional information about magnet component positions (conductor, wedges, collars, etc.) throughout the magnet manufacturing process (cable winding, collaring, yoked/skinned). An analysis technique will be presented and measurement accuracies will be discussed.

22032 (SSCL-Preprint–420) **Industrial metrology as applied to large physics experiments.** Veal, D. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011123. Source: OSTI; NTIS; INIS; GPO Dep.

A physics experiment is a large complex 3-D object (typ. 1200 m^3, 35000 tonnes), with sub-millimetric alignment requirements. Two generic survey alignment tasks can be identified; first, an iterative positioning of the apparatus subsystems in space and, second, a quantification of as-built parameters. The most convenient measurement technique is industrial triangulation but the complexity of the measured object and measurement environment constraints frequently requires a more sophisticated approach. To enlarge the "survey alignment toolbox" measurement techniques commonly associated with other disciplines such as geodesy, applied geodesy for accelerator alignment, and mechanical engineering are also used. Disparate observables require a heavy reliance on least squares programs for campaign pre-analysis and calculation. This paper will offer an introduction to the alignment of physics experiments and will identify trends for the next generation of SSC experiments.

22033 (SSCL-Preprint–422) **A quench detection/logging system for the SSCL Magnet Test Laboratory.** Kim, K.; Coles, M.; Dryer, J.; Lambert, D. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–110: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE95011124. Source: OSTI; NTIS; INIS; GPO Dep.

The quench in a magnet describes a process which occurs while the superconductivity state goes to the normal resistive state. The consequence of a quench is the conversion of the stored electromagnetic energy into heat. During this process the initiating point will reach a high temperature, which will char the insulation or melt the conductor and thereby destroy the magnet. To prevent the magnet from being lost, it is standard practice to observe several resistance and/or inductance voltages across the magnet as quench signatures – detection. When a quench symptom is detected, protection operations are initiated: proper shutdown of the magnet excitation systems and treatment to dilute the heat energy at a spot – protection. The temperature rise is diluted by firing heaters along the length of the magnet to insure that the dissipated energy is spread. To develop a reliable quench detection system, two distinct approaches have been tried in the past: (i) Understanding of the Noise Mechanism and Sub-system Optimization, and (ii) Escaping from the Known Electromagnetic Noises by Observing Optical Waves or Acoustic Waves. The MTL of SSCL confronts a mass-measurement of about 10,000 production magnets. To meet the testing schedule, the false quench detection rate needs to be further optimized while the true quench detection rate remains secure for the magnet measurement safety. To meet these requirements, we followed an iterative top-down approach. First we defined the signal and noise characteristics of the quench phenomena by using existing software tools to build a rapid prototype system incorporating all proven functionality of the existing system. Then we further optimize the system through iterative upgrading based on our signal and noise character findings.

22034 (SSCL-Preprint–431) **SSC string test facility for superconducting magnets: Testing capabilities and program for collider magnets.** Kraushaar, P.; Burgett, W.; Dombeck, T.; McInturff, A.; Robinson, W.; Saladin, V. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–523: PAC '93: international particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE95011125. Source: OSTI; NTIS; INIS; GPO Dep.

The Accelerator Systems String Test (ASST) R&D Testing Facility has been established at the SSC Laboratory to test Collider and High Energy Booster (HEB) superconducting magnet strings. The facility is operational and has had two testing periods utilizing a half cell of collider prototypical magnets with the associated spool pieces and support systems. This paper presents a description of the testing capabilities of the facility with respect to components and supporting subsystems (cryogenic, power, quench protection, controls and instrumentation), the planned testing program for the collider magnets.

22035 (SSCL-Preprint–434) **Collider scenario implications of ASST Operation.** McInturff, A.D. (and others); Burgett, W.; Christianson, M. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–524: PAC '93: international particle accelerator

conference, Washington, DC (United States), 17-20 May 1993). Order Number DE95011126. Source: OSTI; NTIS; INIS; GPO Dep.

After the achievement of the SSCL's Congressionally Mandated milestone, the Accelerator System String Test (ASST) half cell under went a series of power tests. These tests involved quenches induced in various configurations and in power levels up to the maximum operation point. These tests have produced data which has defined various parameters and requirements for the individual elements and system.

22036 (SSCL-Preprint–450) **Conceptual design of the CEM design of the data acquisition system.** Bowden, M.; Dorenbosch, J.; Kapoor, V. Superconducting Super Collider Lab., Dallas, TX (United States). Jun 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930640–9: RT '93: 8th IEEE conference on real-time computer applications in nuclear, particle and plasma physics, Vancouver (Canada), 8-11 Jun 1993). Order Number DE95011128. Source: OSTI; NTIS; INIS; GPO Dep.

The design of a large scale data acquisition system for the GEM detector at the Superconducting Super Collider (SSC) is presented. This architecture supports high-bandwidth data transfer using parallel point-to-point links and a scalable switching network. Substantial buffering enables the use of high latency, selective triggering based on either hardware or software implementations. The system throughput can be expanded to greater than 40 Gbps per second at trigger rates of 100 KHz.

22037 (SSCL-Preprint–455) **Constant of thermal heat conduction and stabilization of the bus bar conductor for superconducting accelerators.** Lopez, G. Superconducting Super Collider Lab., Dallas, TX (United States). Jul 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930703–46: International cryogenic materials conference (ICMC), Albuquerque, NM (United States), 12-16 Jul 1993). Order Number DE95011132. Source: OSTI; NTIS; INIS; GPO Dep.

Using the one-dimensional, time-independent conduction state, a constant of thermal heating conduction is given that brings about the known stabilization theorem and a closed expression for the bus bar to be cryogenically stable in superconducting accelerators.

22038 (SSCL-Preprint–458) **Higher efficiency active quenching circuit for avalanche photodiodes.** Fenker, H.; Regan, T.; Thomas, J.; Wright, M. Superconducting Super Collider Lab., Dallas, TX (United States). Jun 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011133. Source: OSTI; NTIS; INIS; GPO Dep.

An improved circuit for actively quenching and recharging avalanche photodiodes (APDs) which allows them to be biased to at least 30V above breakdown is presented. Using this circuit it is possible to achieve the high single photon detection efficiency inherent in Geiger mode APDs while maintaining a modest deadtime. The circuit is described and observed characteristics of the system are shown.

22039 (SSCL-Preprint–471) **Industrial harmonic analysis system for magnetic measurements of SSC collider arc and high energy booster corrector magnets.** Green, M.I.; Sponsel, R.; Sylvester, C. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–117: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE95011135. Source: OSTI; NTIS; INIS; GPO Dep.

The SSCL collider arc and high energy booster corrector magnets are 50 mm bore cryogenic magnets. The integral strength and harmonics will be measured by industry at full current at 4.2 K and at plus and minus 400 mA at room temperature. Dipoles, quadrupoles, and sextupoles have error tolerances of a few tens of units. A prototype harmonic analysis system for magnetic measurements of production and prototype dipole, quadrupole and sextupole magnets has been designed and is being fabricated. We describe the criteria for search coil designs, data acquisition system hardware and software. Radial search coil arrays are being fabricated utilizing multifilar wire. Two digital integrators will allow simultaneous accumulation of unbucked and bucked configurations.

22040 (SSCL-Preprint–479) **Off-line analysis software for the Texas Test Rig.** Yost, G.P. GEM Collaboration. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–120: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE95011199. Source: OSTI; NTIS; INIS; GPO Dep.

Data analysis for the TTR requires integrating a large number of muon chamber technologies, each with different requirements, into a single analysis chain. Many of these technologies come with their own software, which have different conventions; these packages are grafted on. Data are stored on a tape robot with essential information stored in a database where it may be queried. Operation is done from special-purpose X™ windows designed to facilitate data selection and its subsequent analysis. Program development was done using the Hewlett-Packard Softbench™ product.

22041 (SSCL-Preprint–494) **Thermal conductivity of commercially available 21-6-9 stainless steel.** Yuecel, A.; Maddocks, J.R. Superconducting Super Collider Lab., Dallas, TX (United States). Aug 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011137. Source: OSTI; NTIS; INIS; GPO Dep.

Thermal conductivity values of 21-6-9 stainless steel over the temperature range of 5 K to 120 K are reported. Thermal conductivity integrals are measured using a steady-state heat flux method. The resulting data are fit with a polynomial and differentiated to obtain the conductivity. The derived conductivity is compared to published data for high-manganese stainless steels and to data for other stainless steels. A discussion of the methodology and its accuracy is included.

22042 (SSCL-Preprint–500) **Status of superconducting magnets for the Superconducting Super Collider.** Schermer, R.I. Superconducting Super Collider Lab., Dallas, TX (United States). Sep 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930926–42: 13. international conference on magnet technology, Victoria (Canada), 20-24 Sep 1993). Order Number DE95011200. Source: OSTI; NTIS; INIS; GPO Dep.

The arc sections of the High Energy Booster and the two Collider Rings will need more than 10,000, very large, superconducting dipole and quadrupole magnets. Development work on these magnets was carried out at US/DOE laboratories in a program that began in the mid 1980's. In 1991-1992, the technology was transferred to industry and twenty, full-length, Collider dipoles were successfully fabricated and tested. This program, along with HERA and Tevatron experience, has provided industry a data base to use in formulating detailed designs for the prototypes of the accelerator magnets, with an eye to reducing cost and enhancing producibility. Several model magnets from this latest phase of the industrial program have already been tested. The excessive ramp-rate sensitivity of the magnets is understood and solutions are under investigation.

22043 (SSCL-Preprint–508) **Heat leak performance of SSC collider dipole magnets.** Weisend, J.G. II (Superconducting Super Collider Lab., Dallas, TX (United States)); Levin, M.; Franks, D.; Pletzer, R.; Augustynowicz, S.; McInturff, A.D.; Boroski, W.B. Superconducting Super Collider Lab., Dallas, TX (United States). Sep 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930926–41: 13. international conference on magnet technology, Victoria (Canada), 20-24 Sep 1993). Order Number DE95011222. Source: OSTI; NTIS; INIS; GPO Dep.

The large number of superconducting dipoles in the SSC results in a stringent heat leak budget for each dipole. Ensuring that the dipoles meet this budget is vital to the successful operation or the collider. This work surveys heat leak measurements taken during 4 different magnet string tests. These tests involved both 40 mm and SO mm aperture dipoles. In these experiments the heat leak to the 80 K shield, 20 K shield and cold mass are measured. The results

are compared to predictions from a computational thermal model of the dipole cryostat. Discrepancies are seen between the predicted and measured values. Possible explanations for these discrepancies are given.

22044 (SSCL-Preprint–521) **Superconducting magnets, cryostats, and cryogenics for the interaction region of the SSC.** Jayakumar, R.J. (and others); Abramovich, S.; Zhmad, A. Superconducting Super Collider Lab., Dallas, TX (United States). Oct 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011216. Source: OSTI; NTIS; INIS; GPO Dep.

The Superconducting Super Collider (SSC) has two counterrotating 20-TeV proton beams that will be made to collide at specific interaction points to carry out high energy physics experiments. The Collider ring has two sites, West and East, for such Interaction Regions (IRs), and the conceptual design of the East Interaction Region is underway. The East IR, in the present stage of design, has two interaction points, the requirements for which have been specified in terms of distance L* to the nearest magnet and the beam luminosity. Based on these requirements, the optics for transition from arc regions or utility regions to the IR and for focusing the beams have been obtained. The optical arrangement consists of a tuning section of quadrupoles, the strength of which is adjusted to obtain the required beta squeeze; a pair of bending dipoles to reduce the beam separation from the nominal 900 mm to 450 mm; an achromat section of quadrupoles, which consist of two cold masses in one cryostat; another pair of dipoles to bring the beams together at the required crossing angle; and a set of final focus quads facing the interaction point. The optics is symmetric about the interaction point, and the two interaction points are separated by a hinge region consisting of superconducting dipoles and quadrupoles similar to the arc region. In the regions where the beams are vertically bent and straightened out by dipoles, the beam traverses warm regions provided for placing beam collimators. The superconducting magnets, including the final focus quadrupoles, operate with supercritical He at 4 atm and a nominal temperature of 4.15 K. In this paper, descriptions of the magnets, the cryostats, and cryo bypasses around the warm region and interaction points are provided. Also discussed are the cooling requirements and design for the final focus quadrupole, which receives significant heat load from beam radiation.

22045 (SSCL-Preprint–522) **SSCL RFQ-DTL Matching Section instrumentation.** Datte, P. (and others); Aielo, R.; Hayworth, M. Superconducting Super Collider Lab., Dallas, TX (United States). Nov 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011215. Source: OSTI; NTIS; INIS; GPO Dep.

A description of the SSCL RFQ-DTL Matching Section instrumentation is presented with emphasis on design issues and early instrumentation commissioning results. The H^- beam energy through the RFQ-DTL matching section is 2.5 MeV, the beam current is 27 mA with a pulse width of 35 lts. The typical beam diameter is 3 mm. The instrumentation consists of three beam position monitors (BPM), a wire scanner, beam loss monitors (BLM), a slit and collector emittance measurement unit (EMU), a current toroid, and a Faraday cup. The instruments were designed to accommodate high current densities, have a large dynamic range with moderate bandwidths, and fit congested spaces.

22046 (SSCL-Preprint–525) **Evolution of the rf systems layout for the SSC collider rings.** Schaffer, G. Superconducting Super Collider Lab., Dallas, TX (United States). Oct 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-931039–4: 6. workshop on RF superconductivity, Newport News, VA (United States), 4-8 Oct 1993). Order Number DE95011138. Source: OSTI; NTIS; INIS; GPO Dep.

This note contains information on the results of ongoing reviews concerning the basic design of the 360-MHz rf systems for the 2 x 20 TeV Superconducting Super Collider (SSC). For generation of 20-MV peak voltage per ring, with proton beams of 2 x 70 mA, several versions have been investigated: Version A (baseline design and modified baseline): 2 x 8 five-cell normalconducting cavities; Version B: 2 x 24 single-cell normalconducting cavities; and Version C: 2 x 8 or 2 x 10 single-cell superconducting cavities. For reasons of easier High Order Mode (HOM) damping, multicell cavities have been found inferior in performance when compared to single cells. Superconducting cavities have been found superior in handling transient beam loading when compared to normalconducting cavities. A threefold higher voltage, and a reduced R/Q value of superconducting cells lead to a ninefold increase in stored electromagnetic energy which, by the same factor, reduces the speed of phase changes originating from notches in the circulating beams. The theoretical possibility to operate superconducting cavities half-detuned in order to supply reactive power to the beam may also lead to considerable savings in overall power consumption. On the other hand, many challenges are involved with the use of superconducting cavities, such as the delicacy of the superconductive state, the complexity of cryostat design and operation, tuning requirements, sensitivity to vibration, and other issues.

22047 (SSCL-Preprint–551) **Interstrand resistance of SSC magnets.** Kovachev, V.T. (Superconducting Super Collider Lab., Dallas, TX (United States)); Neal, M.J.; Capone, D.W. II; Carr, W.J. Jr.; Swenson, C. Superconducting Super Collider Lab., Dallas, TX (United States). Jan 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011154. Source: OSTI; NTIS; INIS; GPO Dep.

In situ interstrand resistance measurements were conducted on selected section of the inner coil of a full size (15 m) and a short (1 m) model SSC magnets. A model for evaluating single contacts resistance between two strands was developed. Using this model analyses of adjacent and non-adjacent strand contacts were performed. The interstrand resistance distribution throughout the coil was found to correlate with the quench location data as well as with the multipoles decay characteristics of the magnet. An anisotropic continuum based model for evaluation of cable eddy current losses was developed and results were compared with the experimental data.

22048 (SSCL-Preprint–557) **Resolution measurement of an Interpolating Pad Chamber in the 9 GeV/c π^- beam at BNL.** Fenker, H. (and others); Morgan, K.; Sypit, R. Superconducting Super Collider Lab., Dallas, TX (United States). 7 Mar 1994. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011036. Source: OSTI; NTIS; INIS; GPO Dep.

Results axe presented from the first test of a full size barrel prototype Interpolating Pad Chamber for the GEM central tracker in the 9 GeV/c π^- beam at the Brookhaven AGS. An average resolution of 45 μm has been achieved using electronics functionally identical to the final GEM design. Two 50 mRad stereo pad layers combine to give 680 μm resolution in the direction along the chamber. A calibration procedure which uses the data to measure the gains and pedestals for each pad has been developed and is presented together with resolution results from the silicon telescope used to project the tracks into the pad chambers.

22049 (SSCL-Preprint–560) **A 40 GByte/s read-out system for GEM.** Bowden, M.; Carrel, J.; Dorenbosch, J.; Kapoor, V. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1994. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011158. Source: OSTI; NTIS; INIS; GPO Dep.

The preliminary design of the read-out system for the GEM (Gammas, Electrons, Muons) detector at the Superconducting Super Collider is presented. The system reads all digitized data from the detector data sources at a Level 1 trigger rate of up to 100 kHz. A total read-out bandwidth of 40 GBytes/s is available. Data are stored in buffers that are accessible for further event filtering by an on-line, processor farm. Data are transported to the farm only as they are needed by the higher-level trigger algorithms, leading to a reduced bandwidth requirement in the Data Acquisition System.

22050 (SSCL-Preprint–568) **Ramp-rate sensitivity of SSC dipole magnet prototypes.** Devred, A.; Ogitsu, T. Superconducting Super Collider Lab., Dallas, TX (United States). Jul 1994. 129p. Sponsored by USDOE, Washington, DC (United States). DOE

Contract AC35-89ER40486. Order Number DE95011162. Source: OSTI; NTIS; INIS; GPO Dep.

One of the major achievements of the magnet R&D program for the Superconducting Super Collider (SSC) is the fabrication and test of a series of 20 5-cm aperture, 15-m long dipole magnet prototypes. The ramp rate sensitivity of these magnets appears to fall in at least two categories that can be correlated to the manufacturer and production batch of the strands used for the inner-coil cables. The first category, referred to as type-A, is characterized by a strong quench current degradation at high ramp rates, usually accompanied by large distortions of the multipole fields and large energy losses. The second category, referred to as type-B, is characterized by a sudden drop of quench current at low ramp rates, followed by a much milder degradation at larger rates. The multipole fields of the type-B magnets show little ramp-rate sensitivity, and the energy losses are smaller than for the type-A magnets. The behavior of the Type-A magnets can be explained in terms of inter-strand eddy currents arising from low and non-uniform resistances at the crossovers between the strands of the two-layer Rutherford-type cable. Anomalies in the transport-current repartition among the cable strands are suggested as a possible cause for the type-B behavior. The origins of these anomalies have not yet been clearly identified. The SSC project was canceled by decision of the United States Congress on October 21, 1994.

22051 (SSC-SR–1032) **Report of the SSC workshop on distributed multipole correction coils. Task force report.** Sah, R. (ed.). Superconducting Super Collider Lab., Dallas, TX (United States). Jan 1988. 220p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000 ; AC35-89ER40486. (CONF-8710536–Summ.: SSC workshop on distributed multipole correction coils, Upton, NY (United States), 13-14 Oct 1987). Order Number DE95011093. Source: OSTI; NTIS; GPO Dep.

The SSC Workshop on Distributed Multipole Correction Coils was held at Brookhaven National Laboratory on October 13 and 14, 1987. This Workshop was organized by the SSC Central Design Group, and its purpose was to discuss the present status of specifications, designs, and R&D plans for distributed, actively-powered multipole correction coils for the SSC. The Workshop was organized into four consecutive sessions to discuss the following topics: requirements for distributed correction coils, distributed connection coil designs, materials issues, and plans for future R&D. The following conclusions were drawn from the workshop: Accelerator physics considerations indicate that distributed multipole correction coils represent a feasible and flexible method to correct magnetic field errors in the SSC. Considerable progress has been made by Brookhaven National Laboratory in collaboration with industry to develop a possible fabrication technique for distributed correction coils. This technique consists of imbedding superconducting wire in a flexible plastic substrate. Its feasibility for the SSC still needs to be demonstrated. BNL has presented a preliminary plan for the necessary R&D. A successful technique has been developed to manufacture distributed correction coils for HERA. The coil performance is excellent. As yet, no plan has been proposed to study this type of correction coil for the SSC. The results from an experiment to study radiation damage to organic materials, although still preliminary, am providing guidance in selecting the most radiation resistant materials to use in correction coils. The test samples in this experiment were subjected to much larger radiation doses than expected at the SSC. Considerable information on radiation damage is available in the literature.

22052 (SSC-SR–1034) **SSC 17-meter dipole magnet DD000Z test results and investigation of coil failure: The report of the "Z" Committee.** Coombes, R. (ed.) (Lawrence Berkeley Lab., CA (United States)); Mirk, K.; Tompkins, J.; Zbasnik, J.; Lundy, R.; Schneider, W.; Wanderer, P. Lawrence Berkeley Lab., CA (United States). SSC Central Design Group; Fermi National Accelerator Lab., Batavia, IL (United States); Brookhaven National Lab., Upton, NY (United States). Mar 1988. 107p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000 ; AC35-89ER40486. Order Number DE95011095. Source: OSTI; NTIS; INIS; GPO Dep.

Following the failure of the lower inner coil of magnet DD000Z on November 3, 1987, a committee was formed on November 11 and given the following charges: 'To review the events leading up to and including the failure of the coils of magnet DD000Z. The intent of the review will be to determine the cause of the failure and to make recommendations to reduce the likelihood of such failures in the future. Given the fact that this is the first long magnet to be disassembled, the committee may uncover leads which point to other opportunities for improvement. The committee should follow up on these leads. The committee should prepare a plan to serve as an initial guide for the disassembly and provide guidance as the disassembly progresses.' The committee held its first meeting at FNAL on 17 and 18 Nov to review the record of events leading up to the failure and to establish an initial disassembly procedure. This was followed by further meetings at FNAL, BNL, and CDG, leading to this final report. Committee activities included interviewing personnel who had been involved in the design, assembly and testing of DD000Z, reviewing all documents relating to the magnet and its failure, and participating in and providing guidance during the disassembly. The intention of the committee was to report factual findings, to consider well founded hypotheses, not to consider conjecture and to avoid speculation.

A prototype of the elliptical multipole wiggler (EMW) has been assembled, tested, and magnetically tuned at the APS. This prototype has a period of 160 mm with seven poles for the hybrid structure (antisymmetric configuration) and ten poles for the electromagnetic part of the EMW (symmetric configuration). The hybrid structure of the EMW produces a vertical magnetic field of 0.83 T (K_y = 12) for a gap of 27 mm, and the electromagnet structure provides a maximum horizontal field of 0.12 T (K_x = 1.6) with AC frequency up to 100 Hz. The alternation time is about 3 ms. The requirements for electromagnetic field quality are very tight because the EMW introduces orbit perturbations in the vertical plane, where the emittance is smallest. Also the storage ring correction system cannot respond to perturbations of more than 10 Hz frequency. Thus the main effort during the magnetic tuning of the EMW was directed toward establishing time independence of the magnetic field integrals to better than 2 G-cm while the current was alternating through the electromagnet. This time independence has been achieved by implementing a special field integral compensation system and novel fast magnetic measurement techniques. Magnetic measurements of the EMW prototype have been performed at the APS insertion device magnetic measurement facility. A new fast acquisition system with a maximum sampling rate of 1 MHz has been developed and used for these measurements. Also a novel "twisted coil" technique has been used in order to make fast measurements of the second field integral. The field integral compensation on the order of 1 G-cm and 1,000 G-cm^2 for the first and second integrals, respectively, has been achieved at electromagnet AC frequencies up to 100 Hz.

22054 (BNL–61225) **Construction and testing of arc dipoles and quadrupoles for the relativistic heavy ion collider (RHIC) at BNL.** Wanderer, P. (and others); Muratore, J.; Anerella, M. Brookhaven National Lab., Upton, NY (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–137: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011813. Source: OSTI; NTIS; INIS; GPO Dep.

The production run of superconducting magnets for the Relativistic Heavy Ion Collider (RHIC) project at Brookhaven National Laboratory (BNL) is well underway. Of the 288 arc dipoles needed

for the collider, more than 120 have been delivered. More than 150 arc quadrupoles have been delivered. All of these magnets have been accepted for RHIC. This paper reports the construction and performance of these magnets. Novel features of design and test, introduced to enhance technical performance and control costs, are also discussed. Other papers submitted to this Conference summarize work on the sextupoles and tuning quads, arc correctors, and combined corrector-quadrupole-sextupole assemblies (CQS).

22055 (BNL–61787) **Performance of the SRRC storage ring and wiggler commissioning.** Kuo, C.C. (Synchrotron Radiation Research Center, Taiwan (China)); Hsu, K.T.; Luo, G.H. Brookhaven National Lab., Upton, NY (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–102: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95012082. Source: OSTI; NTIS; INIS; GPO Dep.

A 1.3 GeV synchrotron radiation storage ring at SRRC has been operated for more than a year since October 1993. Starting from April 1994, the machine has been open to the user community. In February 1995, the authors installed a wiggler magnet of 1.8 tesla 25-pole in the ring and successfully commissioned. The machine was scheduled for the users' runs from the middle of April this year. The authors describe the performance of the machine without wiggler magnet system and then report the wiggler effects on the beam dynamics of the storage ring, e.g., tune shift, beta-beating, orbit change, nonlinear dynamics effect, etc. Some measurements are compared with the model prediction and agreement between them was fairly good. Possible actions to minimize wiggler effects have been taken, such as orbit correction as a function wiggler gap change. The machine improvement projects, such as longitudinal and transverse damping systems as well as orbit stability feedback system are under construction and will be in use soon.

22056 (FNAL/C–95/100) **2 × 2 TeV $\mu^+\mu^-$ collider: Lattice and accelerator-detector interface study.** Gelfand, N.M.; Mokhov, N.V. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950512–202: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013238. Source: OSTI; NTIS; INIS; GPO Dep.

The design for a high-luminosity $\mu^+\mu^-$ superconducting storage ring is presented based on first-pass calculations. Special attention is paid to two Iowa interaction regions (IR) whose optics are literally interlaced with the collider detectors. Various sources of backgrounds in IR are explored via realistic Monte Carlo simulations. An improved design of the collider lattice in the neighborhood of the interaction points (EP) is determined by the need to reduce significantly background levels in the detectors.

22057 (INIS-RU–405, pp. 378-381) **Longitudinal polarization studies for VEPP-4M.** Shatilov, D.N.; Zholents, A.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics.* Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

The scheme of spin at VEPP-4M storage ring is considered. The scheme comprises the solenoid and three quadrupole lenses placed at both sides of the solenoid. It is shown, that using such spin rotation scheme a high degree of longitudinal polarization at VEPP-4M can be obtained in the energy of γ(1S) resonance. 7 refs.

22059 (SLAC–95-6788) **Trapped macroparticles in electron storage rings.** Zimmermann, F. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Seeman, J.T.; Zolotorev, M.; Stoeffl, W. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jun 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–186: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014652. Source: OSTI; NTIS; INIS; GPO Dep.

Sudden drops of the beam lifetime ascribed to the capture of positively charged macroparticles ('dust') are observed at many high-energy electron storage rings. A trapped macroparticle has a certain thermal lifetime due to energy transfer from the beam; the interplay of different ionizing and discharging processes gives rise to an equilibrium charge. The beam lifetime is reduced by bremsstrahlung both in the field of the atomic nuclei and in the macroscopic field of the highly charged dust particle. Recent observations at some storage rings can be explained by the capture of a single macroparticle of about micron size, possibly made from silicon dioxide. In the two B factories under construction, PEP-II and TRISTAN-II, trapped macroparticles will be thermally unstable and explode after a few tens of microseconds, thanks to the much higher beam current as compared with other storage rings.

22060 (SLAC–451, pp. 132-155) **A Tau-Charm Factory at BEPC (Preliminary design and parameters).** Wu, Yingzhi (IHEP, Beijing (China)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

The author presents a preliminary design of how a Tau Charm Factory could be added to the Beijing Electron Positron Collider (BEPC) facility. The design is offered independent of the issue of funding, which the facility would need outside help to accomplish. Included in the design are specifications for the storage rings, siting, and design goals.

22061 (SLAC–451, pp. 399-436) **Summary of the Marbella TCF Workshop.** Kirkby, J. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper the author reviews the third workshop on the Tau-Charm Factory, held in Marbella, Spain, on 1-6 June 1993. The aim of the conference was: a thorough review of physics interest in light of recent theoretical and experimental progress; to update designs of accelerators and detectors for such a machine; and to discuss plans for the realization of such a device. The conclusions were that such a device would allow precision study of electroweak physics in tau systems. It would allow comprehensive study of tau and charm systems. It would be complementary to a B factory, providing in general better statistics with lesser systematic effects, and precision charm data for use in B factories. The device and its detector are feasible to design and construct.

22062 (SLAC–451, pp. 437-450) **A Tau-Charm Factory at Argonne.** Repond, J. (Argonne National Lab., IL (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

This report is a preliminary proposal from Argonne National Laboratory for a Tau Charm Factory. The authors argue that APS provides potential facilities, expertise in colliders, expertise in detectors from the HEP section of Argonne, a major laboratory with no major projects on line at present, and a potentially attractive project. The report points out that even in the face of the present

design proposal, actual work on such a device requires support for a facility from the HEP community, ANL management, and DOE.

22063 (SLAC–451, pp. 451-464) **JINR studies for a Tau-Charm Factory.** Chelkov, G. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. 22066 (SLAC-PUB–95-6886) **The effect of phase advance errors between interaction points on beam halos.** Chen, T.; Irwin, J.; Siemann, R.H. Stanford Linear Accelerator Center, Menlo Park, CA (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–94: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95012559. Source: OSTI; NTIS; INIS; GPO Dep.

Phase advance errors between interaction points (IP) break the symmetry of multi-IP colliders. This symmetry breaking introduces new, lower order resonances which may chance the halo from the beam-beam interaction dramatically. In this paper, the mechanism of introducing new resonances is discussed. Simulation results showing the changes due to phase advance errors are presented. Simulation results are compared with experimental measurements at VEPP-2M.

22067 (SLAC-PUB–95-6887) **Studies of halo distributions under beam-beam interaction.** Chen, T.; Irwin, J.; Siemann, R.H. Stanford Linear Accelerator Center, Menlo Park, CA (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–95: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95012560. Source: OSTI; NTIS; INIS; GPO Dep.

The halo distribution due to the beam-beam interaction in circular electron-positron colliders is simulated with a program which uses a technique that saves a factor of hundreds to thousands of CPU time. The distribution and the interference between the beam-beam interaction and lattice nonlinearities has been investigated. The effects on the halo distribution due to radiation damping misalignment at the collision point, and chromatic effect are presented.

44 INSTRUMENTATION

22068 (LA-SUB–94-63) **Fiber optic and sensor technology support. Project progress report.** Day, G.W. Los Alamos National Lab., NM (United States); National Inst. of Standards and Technology (NEL), Boulder, CO (United States). Electromagnetic Technology Div. Oct 1988. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95011063. Source: OSTI; NTIS; GPO Dep.

This briefly summarizes the work done under contract during FY88. The major technical development of the year has been substantial progress in reducing the size of fiber current sensors. The authors have continued the study of the ZnSe magnetic field sensor started last year. They have continued to investigate the possibility of obtaining fibers that would have better properties for magnetic field or current sensing. They investigated a high speed, polarization independent, switch that could be useful for LANL instrumentation applications. They have constructed the fixtures for an experiment to study the Kerr electro-optic effect in optical fiber. The have done some exploratory work on electro-optic deflection, with a view to possible infrared streak camera applications. They have made significant progress, primarily on another contract, in construction techniques that will yield more rugged sensors. They have continued to study bismuth germanate as an electro-optic material. They have continued to provide general support on a wide range of fiber and sensor problems. This has been carried out through visits of NIST staff to LANL and NTS, visits of LANL staff to NIST, numerous phone consultations and participation in technical meetings of particular interest. This year, they participated in and made presentations based on NIST/LANL collaborations at the annual Photonics Workshop, the first DoD Fiber Optics Conference, and the annual SPIE fiber Sensor Symposium. In addition, they have visited companies and attended other conferences and exhibitions to obtain information on new products and techniques that could be of use to LANL staff.

22069 (ANL-HEP-PR–95-8) **Development of a parallel plate proportional counter TRD with suppressed sensitivity to ionization.** Solomey, N. (Chicago Univ., IL (United States). Enrico Fermi Inst.); Krolak, P.; Graham, G.; Dawson, J.W. Argonne National Lab., IL (United States). 3 Feb 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950276–2: 7. Vienna wire chamber conference (WCC-95), Vienna (Austria), 13-17 Feb 1995). Order Number DE95009919. Source: OSTI; NTIS; INIS; GPO Dep.

The development of a Parallel Plate Proportional Counter which has a highly suppressed sensitivity to ionization but retains a good X-ray signal to noise ratio is presented. Details of the laboratory development and actual beam tests showing the e/π rejection are described. Because of its insensitivity to ionization this type of detector can be useful in an environment where the number of minimum ionizing particles are high, but uninteresting; however, the detector is very sensitive to the highly localized electron cloud from converted X-rays making it ideal as a transition radiation X-ray detector. Thus, this detector only gives a signal for charged particles above TR threshold; all other particles below this threshold produce no TR X-rays giving only a pedestal-like signal. The system's potential performance for π/p separation in the intended neutral Hyperon experiment is evaluated.

22070 (ANL/XFD/CP–82883) **Soft x-ray scanning microtomography with submicron resolution.** McNulty, I. (Argonne National Lab., IL (United States)); Haddad, W.S.; Trebes, J.E.; Anderson, E.H. Argonne National Lab., IL (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE

Contract AC03-76SF00098 ; W-31-109-ENG-38 ; W-7405-ENG-48. (CONF-940714–55: International meeting on synchrotron radiation instrumentation, Stony Brook, NY (United States), 18-22 Jul 1994). Order Number DE95011817. Source: OSTI; NTIS; INIS; GPO Dep.

Scanning soft x-ray microtomography was used to obtain high-resolution three-dimensional images of a microfabricated test object. Using a special rotation stage mounted on the scanning transmission x-ray microscope at the XIA Beamline at the National Synchrotron Light Source, we recorded nine two-dimensional projections of the 3D test object over an angular range of −50° to +55°. The x-ray wavelength was 3.6 nm and the radiation dose to the object per projection was approximately 2 x 10^6 Gy. The object consisted of two gold patterns supported on transparent silicon nitride membranes, separated by 4.75 Jim, with 100 to 300-nm wide and 65-nm thick features. We reconstructed a volumetric data set of the test object from the two-dimensional projections using an algebraic reconstruction technique algorithm. Features of the test object were resolved to ~100 nm in transverse and longitudinal extent in three-dimensional images rendered from the volumetric set.

22071 (CEA-DAPNIA–94-08) **A Compton polarimeter for CEBAF Hall A.** Bardin, G.; Cavata, C.; Frois, B.; Juillard, M.; Kerhoas, S.; Languillat, J.C.; Legoff, J.M.; Mangeot, P.; Martino, J.; Platchkov, S.; Rebourgeard, P.; Vernin, P.; Veyssiere, C. CEBAF Hall A Collaboration. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Astrophysique, de la Physique des Particules, de la Physique Nucleaire et de l'Instrumentation Associee. Sep 1994. 5p. (CONF-9409103–: International symposia on high energy spin physics and polarization phenomena in nuclear physics, Bloomington, IN (United States), 15-22 Sep 1994). Order Number DE95631504. Source: OSTI; NTIS (US Sales Only); INIS.

The physic program at CEBAF Hall A includes several experiments using 4 GeV polarized electron beam: parity violation in electron elastic scattering from proton and ^{4}He, electric form factor of the proton by recoil polarization, neutron spin structure function at low Q^2. Some of these experiments will need beam polarization measurement and monitoring with an accuracy close to 4%, for beam currents ranging from 100 nA to 100 microA. A project of a Compton Polarimeter that will meet these requirements is presented. It will comprise four dipoles and a symmetric cavity consisting of two identical mirrors. 1 fig., 10 refs.

22072 (CONF-9506185–1) **Neutron scintillators using wavelength shifting fibers.** Hutchinson, D.P.; Miller, V.C.; Ramsey, J.A. Oak Ridge National Lab., TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From New tools for neutron instrumentation workshop; Les Houches (France); 6-10 Jun 1995. Order Number DE95012841. Source: OSTI; NTIS; INIS; GPO Dep.

A proposed design for an optically-based, one-dimension scintillation detector to replace the gas-filled position-sensitive proportional counter currently used for a wide-angle neutron detector (WAND) at the high-Flux Isotope Reactor (HFIR) at the Oak Ridge National Laboratory (ORNL) is presented. The scintillator, consisting of a mixture of ^{6}LiF and ZnS(Ag) powders in an epoxy binder, is coupled to an array of wavelength shifting optical fibers which provide position resolution. The wide-angle neutron detector is designed to cover a 120 degree arc with a 75 cm radius of curvature. The final detector design provides for 600 optical fibers coupled to the scintillator screen with an angular resolution of 0.2 degrees. Each individual pixel of the detector will be capable of operating at count rates exceeding 1 MHz. Results are presented from the measurement of neutron conversion efficiencies for several screen compositions, gamma-ray sensitivity, and spatial resolution of a 16 element one-dimensional array prototype.

22073 (FEI–2392) **Possibilities of improvement of the DIN-2K spectrometric complex performances.** Novikov, A.G.; Puchkov, A.V.; Stupak, A.I. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 35p. (In Russian). Order Number DE95633646. Source: OSTI; NTIS (US Sales Only); INIS.

The detailed calculations of the neutron spectrometers DIN-2PI and DIN-2PR characteristics for the various modes of their operation are given. The comparison of these instruments with foreign analogous and the possible ways to improve their characteristics are discussed. 16 refs.; 7 figs.; 12 tabs.

22074 (FEI–2397) **Measurement of radiation multiplicity spectra and alpha value for uranium-235.** Grigor'ev, Yu.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.); Georgiev, G.P.; Stanchik, Kh. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 16p. (In Russian). Order Number DE95633647. Source: OSTI; NTIS (US Sales Only); INIS.

Gamma-spectra from 1 to 12 multiplicity were measured on the 500 m flight path of the IBR-30 by means a 16-section scintillation detector with a NaJ(Tl) crystals of a volume of 321 for two metallic samples of thickness 0.00137 a/b and 0.00411 a/b with 90%-uranium-235 and 10%-uranium-238. Spectra of multiplicity were obtained for reserved resonances in the region of energy E=1-150 eV. They were used for determination of the value $\alpha=\sigma_\gamma/\sigma_f$ for 165 resonances of uranium-235. 6 refs.; 8 figs.; 1 tab.

22075 (FNAL/C–95/086) **Review of calorimetry in Fermilab fixed-target experiments.** Crisler, M.B. Fermi National Accelerator Lab., Batavia, IL (United States). Apr 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9410317–3: IHEP: 1994 Beijing calorimetry symposium, Beijing (China), 25-27 Oct 1994). Order Number DE95013001. Source: OSTI; NTIS; INIS; GPO Dep.

The fixed-target program at Fermilab comprises as many as thirteen simultaneous experiments in ten separate beamlines using beams of primary protons, pions, kaons, electrons, neutrinos, and muons. The fixed target beamlines were last in operation in the latter half of 1991, shutting down in 1992. The next fixed target run is scheduled for early 1996. This article describes some of the wide variety of calorimetric devices that were in use in the past run or to be used in the coming run. Special attention is devoted to the new devices currently under construction.

Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950534–1: Conference on real-time computer applications in nuclear, particle and plasma physics (RT), East Lansing, MI (United States), 22-26 May 1995). Order Number DE95012968. Source: OSTI; NTIS; INIS; GPO Dep.

For longer-distant, high speed data links, optical fibre becomes most cost-effective than copper or other hard wire cable systems. Fermilab supplied to Finisar Corp. of Menlo Park, CA., a set of specifications for card functions, sizes and interconnector pin assignments. Finisar designed and assembled a set of fiber optical P.C. cards using 100 megabyte/sec commercial optoelectronics and a serialization and deserialization HOT-ROD chipset designed by GAZELLE Microcircuits, Inc. (A Tri Quint Semiconductors company). The cooperative effort between Fermilab and Finisar has allowed Fermilab to created a reliable 50 Megabytes/sec (40 bit parallel RS485 DART data bus) cable to cable extender using a virtually invisible Fiber Channel point-to-point(FC-0) fiber optical single-simplex system. The system is easily capable of sustaining a 50 megabytes/sec of data, control and status line throughput at distances of 1625 feet (500 meters) using standard multi-mode fiber.

22077 (INIS-JP–028, pp. 36-37) **Measurement of pulse height defect in silicon surface-barrier detectors. 3.** Kanazawa, Satoshi (Kyoto Univ. (Japan). Faculty of Engineering); Kanno, Ikuo; Kimura, Itsuro; Ichihara, Chihiro; Hayashi, S.A. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University*. Order Number DE95709897. Source: OSTI; NTIS; INIS.

The recombination effect in the residual defect of a silicon surface barrier detector was investigated for low energy heavy ions (below 0.2 MeV/amu). The recombination effect had -1/2 power dependence on the electric field strength. It was also found that the

plasma column with higher electron-hole density had less recombination effect, contrary to the case of high energy heavy ions (above 1 MeV/amu). (author).

22078 (INIS-JP–029, pp. 136-137) **Development of NiGe(Pd) Ohmic contacts to n-type GaAs.** Furumai, Masaki (Kyoto Univ. (Japan). Faculty of Engineering); Wakimoto, Hiroki; Oku, Takeo; Murakami, Masanori. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

Contact resistances of NiGe Ohmic contacts were reduced by adding a small amount of Pd to the NiGe contacts. These contacts had smooth surface and shallow diffusion depth. A model for the current transport of the NiGe(Pd) Ohmic contacts was proposed, which explained well the dependencies of the contact resistances on the microstructure at the GaAs/metal interface. (author).

22079 (INIS-mf–14548, pp. 15-23) **The SSDL Argentina - Ready to provide TLD intercomparison service for hospitals in Latin-America.** Saravi, M. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina)); Papadopulos, S.; Mugliaroli, H. International Atomic Energy Agency, Vienna (Austria); World Health Organization, Geneva (Switzerland). Dec 1993. 27p. In *SSDL Newsletter. No.32.* Order Number DE95633405. Source: OSTI; NTIS (US Sales Only); INIS.

Thermoluminescence dosimeters (TLD) are widely used to verify absorbed dose delivered from radiation therapy beams. The Secondary Standard Dosimetry Laboratory (SSDL) of Argentina uses TLD for its mailed dose intercomparison programme for cobalt 60 radiation therapy units. The method and technique employed by the SSDL are analyzed. In 1992 and 1993 the SSDL participated in the IAEA Quality Control Programme for the TLD postal dose intercomparison service of this laboratory. The results of the QC Programme indicate that the dose evaluated by the SSDL TLD service for participant centers is about 1% lower than that evaluated by the IAEA TLD service. This deviation is accepted taking into account that a $\pm$ 2% dose uncertainty for TLD dosimetry is reasonable. (author). 5 refs, 3 figs, 4 tabs.

Source: OSTI; NTIS (US Sales Only); INIS.

The system of NMR spectrum registration for target polarization measurement is described. The system consists of an oscillator of the Q-meter, the voltage-to-code converters, the phase detector and the controlled phase rotator. The system was controlled by minicomputer through CAMAC units. The equilibrium deuteron absorption spectrum obtained by means of this system is presented for T=0.73 K and f=15.82 MHz. 4 refs.

The method of beam polarization measurement on high-energy electron-positron linear colliders is proposed. It is based on the effect of spatial separation of electrons or positrons moving in homogeneous magnetic field and having opposite spin projection on the field direction. The method can be employed in linear colliders with energies up to 1000 GeV. 3 refs.

Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1994. 12p. Order Number DE95632458. Source: OSTI; NTIS (US Sales Only); INIS.

The construction of the stereoscopic meso-optical Fourier transform microscope (MFTM) with double focusing for particle tracks of low ionization level in the nuclear emulsion is described. It is shown that in the stereoscopic prototype of the MFTM with double focusing there is no ambiguity in the interpretation of the data about the (x,z)-coordinates of the particle track. The experimental error of the orientation angle $\theta_{x,y}$ is as low as 1,5' (angular minute). The data gathered over the length of the particle track 6 mm enables us to check the genetic unity of the particle tracks going from the vertex point, to fix the small angle scattering events and to isolate some local geometrical distortions in the nuclear emulsion. 3 refs., 11 figs.

22095 (JINR-E–13-94-502) **Investigation of the Geometrical Distortions in the Nuclear Emulsion.** Batusov, Yu.A.; Rumyantseva, V.P.; Soroko, L.M.; Tereshchenko, V.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1994. 14p. Order Number DE95631509. Source: OSTI; NTIS (US Sales Only); INIS.

The geometrical distortions in the nuclear emulsion were investigated by means of two devices: (1) stereoscopic meso-optical Fourier transform microscope (MFTM) and (2) traditional optical microscope (KSM-1) designed for precise measurements. The particle tracks were produced by primary Oxygen-nuclei with impulse 65.6 GeV/c and by secondary α-particles in various regions of the nuclear emulsion. The measurement errors were: 1.8' (angular minute) for orientation angle θ_{xy}; 2.7' (angular minute) for dip angle θ_z; 0.3 μm for transverse coordinate x; 0.1 μm for longitudinal coordinate y and 0.3 μm for depth coordinate z. The effect of the global forced bending of the nuclear emulsion glass support was detected and estimated as $d\theta_z/dy$=2' (angular minute) per mm. To suppress the local geometrical distortions, a difference plot was calculated for two secondary α-particles going very close within $\leq$ 10 μm over the distance 6 mm. It was shown that this mode of the local geometrical distortions is kept constant over the mutual transverse distances up to 0.6 mm. By observing the zy-plots of four secondary α-particles we have isolated the rotating mode of the local geometrical distortions in the nuclear emulsion. 5 refs., 11 figs.

22096 (LA-UR–95-324) **Gamma-ray spectroscopy of in-situ SNM with the M^{3}CA and a new room-temperature detector.** Russo, P.A.; Close, D.A.; Hsue, S.T.; Sprinkle, J.K. Jr.; Sumner, M.C. Los Alamos National Lab., NM (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950923–2: 5. international conference on facility-safeguards interface, Jackson Hole, WY (United States), 24-30 Sep 1995). Order Number DE95006278. Source: OSTI; NTIS; GPO Dep.

Compact, rugged, efficient, and reliable room-temperature gamma ray detectors with better energy resolution are need for in situ applications. These improved detectors are sought as alternatives to the compact NaI(T1) detectors now available. A promising approach is an elegant new design that benefits fully form the recent advances in solid-state materials technology for production of large, good quality crystals of CdZnTe for room-temperature gamma ray spectroscopy. The new detector, equipped with simple but innovative electrode technology to address intrinsic charge-collection deficiencies, operates with the new self-contained portable gamma spectroscopy system, the miniature modular multichannel analyzer (M^{3}CA), without added layers of electronic complexity for pulse processing. Applications of in situ NDA for

portable determinations of fixed uranium and plutonium quantities and the continuous assay of dynamic quantities of these materials will provide the test criteria for evaluating the performance of such detectors operating with the M^3CA.

22097 (LA-UR-95-1564) **Nonproliferation and safeguarding via ionization detection.** Koster, J.E.; Johnson, J.P.; Steadman, P. Los Alamos National Lab., NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512-151: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011974. Source: OSTI; NTIS; INIS; GPO Dep.

A significant signature of the presence of special nuclear material (SNM) is ionizing radiation. SNM naturally decays with the emission of alpha particles, gamma rays, and neutrons. Detecting and monitoring these emissions is an important capability for international safeguards. A new detection method collects the ions produced by such radiation in ambient air. Alpha particles in particular are specific to heavy nuclei but have very short range. The ions produced by an alpha, however, can be transported tens of meters to an ion detector. These new monitors are rugged, very sensitive, respond in real time, and in most cases are quite portable.

22098 (LBL-36711) **A superconducting linear motor drive for a positive displacement bellows pump for use in the g-2 cryogenics system.** Green, M.A. Brookhaven National Lab., Upton, NY (United States); Lawrence Berkeley Lab., CA (United States). Oct 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016 ; AC03-76SF00098. (CONF-941013-40: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95012323. Source: OSTI; NTIS; INIS; GPO Dep.

Forced two-phase cooling of indirectly cooled magnets requires circulation of liquid helium through the magnet cooling channel. A bellows helium pump is one possible way of providing helium flow to a magnet cooling system. Since the bellows type of helium pump is immersed in liquid helium, a superconducting linear motor drive appears to be an attractive option. This report describes a linear motor drive that employs oriented permanent magnet materials such as samarium-cobalt as the stator magnet system and a superconducting loud speaker voice coil type of drive as the armature of the linear motor. This report examines drive motor requirements for a helium pump.

22099 (LBL-36908) **Development of silicon drift detectors for strangeness measurements.** Odyniec, G.; Krieger, B.; Krofcheck, D.; Lewak, D.; O'Donnel, R.; Partlan, M.; Walton, J.T.; Wang, N.W. Lawrence Berkeley Lab., CA (United States). Feb 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950172-3: Strangeness in hadronic matter conference, Tucson, AZ (United States), 3-7 Jan 1995). Order Number DE95012366. Source: OSTI; NTIS; INIS; GPO Dep.

Detection of multi-strange and charm particles requires precise measurements of the secondary vertices close to the interaction point and the decay products of strange and charm particles. This presents an unprecedented challenge for relativistic heavy ion experiments, where multiplicity reaches thousands of final state particles per collision. Development of affordable technology for realizing high spatial resolution and low mass vertex detectors has become the ultimate goal of many R&D projects in major laboratories. In this paper we present preliminary results on silicon drift detectors fabricated for the first time on p-type silicon substrates. These detectors were designed, fabricated and tested recently at LBL and show very interesting properties which make their use in future experiments very likely.

22100 (LBL-37096) **Detection of charged particles and X-rays by scintillator layers coupled to amorphous silicon photodiode arrays.** Jing, T. (Lawrence Berkeley Lab., CA (United States)); Drewery, J.; Hong, W.S.; Lee, H.; Kaplan, S.N.; Perez-Mendez, V.; Goodman, C.A.; Wildermuth, D. Lawrence Berkeley Lab., CA (United States). Apr 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950412-13: Spring meeting of the Materials Research Society (MRS), San Francisco, CA (United States), 17-21 Apr 1995). Order Number DE95012375. Source: OSTI; NTIS; INIS; GPO Dep.

Hydrogenated amorphous silicon (a-Si:H) p-i-n diodes with transparent metallic contacts are shown to be suitable for detecting charged particles, electrons, and X-rays. When coupled to a suitable scintillator using CsI(Tl) as the scintillator we show a capability to detect minimum ionizing particles with S/N ~20. We demonstrate such an arrangement by operating a p-i-n diode in photovoltaic mode (reverse bias). Moreover, we show that a p-i-n diode can also work as a photoconductor under forward bias and produces a gain yield of 3-8 higher light sensitivity for shaping times of 1 μs. n-i-n devices have similar optical gain as the p-i-n photoconductor for short integrating times ($< 10\mu$s). However, n-i-n devices exhibit much higher gain for a long term integration (10ms) than the p-i-n ones. High sensitivity photosensors are very desirable for X-ray medical imaging because radiation exposure dose can be reduced significantly. The scintillator CsI layers we made have higher spatial resolution than the Kodak commercial scintillator screens due to their internal columnar structure which can collimate the scintillation light. Evaporated CsI layers are shown to be more resistant to radiation damage than the crystalline bulk CsI(Tl).

22101 **Gamma radiation detector.** Hofstetter, K.J. To Dept. of Energy. 1993. Filed date 4 Jan 1993. U.S. Patent Application 8-000,309. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95009952. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a radiation detector and a radioluminescent composition for use therein. The detector includes a radioluminescent composition that emits light in a characteristic wavelength region when exposed to gamma radiation, and means for detecting said radiation. The composition contains a scintillant such as anglesite ($PbSO_4$) or cerussite ($PbCO_3$) incorporated into an inert, porous glass matrix via a sol-gel process. Particles of a radiation-sensitive scintillant are added to a sol solution. The mixture is polymerized to form a gel, then dried under conditions that preserve the structural integrity and radiation sensitivity of the scintillant. The final product is a composition containing the uniformly-dispersed scintillant in an inert, optically transparent and highly porous matrix. The composition is chemically inert and substantially impervious to environmental conditions including changes in temperature, air pressure, and so forth. It can be fabricated in cylinders, blocks with holes therethrough for flow of fluid, sheets, surface coatings, pellets or other convenient shapes.

22102 (PNL-SA-20757) **Sensitivity of LDEF foil analyses using ultra-low background germanium vs. large NaI(Tl) multidimensional spectrometers.** Reeves, J.H.; Arthur, R.J.; Brodzinski, R.L. Pacific Northwest Lab., Richland, WA (United States). Jun 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9206240-3: 2. Long Duration Exposure Facility (LDEF) post-retrieval symposium, San Diego, CA (United States), 1-5 Jun 1992). Order Number DE95011491. Source: OSTI; NTIS; INIS; GPO Dep.

Cobalt foils and stainless steel samples were analyzed for induced ^{60}Co activity with both an ultra-low background germanium gamma-ray spectrometer and with a large NaI(Tl) multidimensional spectrometer, both of which use electronic anticoincidence shielding to reduce background counts resulting from cosmic rays. Aluminum samples were analyzed for ^{22}Na. The results, in addition to the relative sensitivities and precisions afforded by the two methods, are presented.

22103 (SAND-95-1087C) **An "exact" treatment of self-shielding and covers in neutron spectra determinations.** Griffin, P.J.; Kelly, J.G. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950716-2: 32. annual IEEE international nuclear and space radiation effects conference, Madison, WI (United States), 17-21 Jul 1995). Order Number DE95013023. Source: OSTI; NTIS; INIS; GPO Dep.

Most neutron spectrum determination methodologies ignore self-shielding effects in dosimetry foils and treat covers with an exponential attenuation model. This work provides a quantitative analysis of the approximations in this approach. It also provides a methodology for improving the fidelity of the treatment of the dosimetry sensor response to a level consistent with the user's spectrum characterization approach. A library of correction functions for the energy-dependent sensor response has been compiled that addresses dosimetry foils/configurations in use at the Sandia National Laboratories Radiation Metrology Laboratory.

22104 (SLAC-PUB–95-6890) **Detector solenoid compensation in the PEP-II B-Factory.** Nosochkov, Y. (Stanford Univ., CA (United States). Stanford Linear Accelerator Center); Cai, Y.; Irwin, J.; Sullivan, M.; Forest, E. Stanford Linear Accelerator Center, Menlo Park, CA (United States); Lawrence Berkeley Lab., CA (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515 ; AC03-76SF00098. (LBL–37227; CONF-950512–97: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95012562. Source: OSTI; NTIS; INIS; GPO Dep.

The PEP-II experimental detector includes a strong 1.5 T solenoid field in the interaction region (IR). With the fringe fields, the solenoid extends over a range of 6 m. Additional complications are that (1) it is displaced longitudinally from the interaction point (IP) by about 40 cm, (2) neither beam is parallel to the solenoid axis, and (3) the solenoid overlaps a dipole and a quadrupole on either side of the IP. In each half IR the correction system includes a set of skew quadrupoles, dipole correctors and normal quadrupoles to independently compensate the coupling, orbit perturbation, dispersion and focusing effect produced by the solenoid. The correction schemes for the Low Energy Ring (LER) and for the High Energy Ring (HER) are described, and the impact on the dynamic aperture is evaluated.

22105 (SSCL-Preprint–256) **Overview of the GEM muon system cosmic ray test program at the SSCL.** Milner, E.C. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–116: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE95011115. Source: OSTI; NTIS; INIS; GPO Dep.

Muon track resolution exceeding 75-μm per plane is one of the main strengths of the GEM detector design, and will be crucial in searches for Higgs Bosons, heavy Z-Bosons, technicolor, and supersymmetry. Achieving this resolution coal requires improved precision in muon chambers and their alignment. A cosmic ray test stand known as the Texas Test Rio, (TTR) has been created at the SSCL for studying candidate GEM muon chamber technologies. Test results led to selecting Cathode Strip Chambers (CSC) as the GEM muon system baseline chamber technology.

22106 (UCRL-ID–120664) **Calibration of density logs at the Nevada Test Site.** Hearst, J.R. Lawrence Livermore National Lab., CA (United States). Apr 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012481. Source: OSTI; NTIS; GPO Dep.

During the evaluation of a proposed site for an underground nuclear test at the Department of Energy's Nevada Test Site (NTS) it was important to measure the bulk density of the geological formation in which the test was to be executed. The most satisfactory method for this measurement is the density log. This is a measurement system in which a gamma-ray source and detector are mounted in an instrument (a sonde) which is lowered into a borehole by a multi-conductor cable, and the number of gamma rays detected is used to infer the bulk density. At NTS many of the boreholes of interest are air-filled, with diameters as large as 3.65 m, drilled in partially-saturated media. Consequently the commercial equipment and calibration procedures are not suitable for NTS conditions. The count rate from a density sonde is strongly affected by any gap between the sonde and the borehole wall, especially if the gap is filled with air rather than water. Modern commercial density logs employ two detectors, and use one of the detectors to compensate for borehole conditions such as mudcake and gap. The commercial compensation algorithms assume that the sonde is parallel to the borehole wall; a reasonable assumption for oilfield conditions but not for NTS conditions. Moreover, in an air-filled borehole, borehole diameter affects both the calibration and the compensation. Therefore we could not use commercial algorithms to deal with NTS conditions. For many years, no appropriate two-detector algorithm was available for the NTS situation. Consequently we developed special algorithms for a single-detector sonde, which was equipped to measure the gap directly. Recently a two-detector algorithm was developed, which appears to be satisfactory if the sonde is calibrated in the appropriate-diameter borehole. In this report we describe the calibration procedures and the algorithms for both methods.

22107 (UCRL-JC–119291) **Low-energy response of superconducting tunnel junction x-ray spectrometers.** Labov, S.E. (Lawrence Livermore National Lab., CA (United States)); Hiller, L.H.; Measrs, C.A.; Frank, M.; Netel, H.; Azgui, F.; Barfknecht, A.T. Lawrence Livermore National Lab., CA (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-48. Contract NAS5-38013; Grant NAGW-3907. (CONF-941013–37: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95011733. Source: OSTI; NTIS; GPO Dep.

Thin film structures incorporating metallic superconducting layers and tunnel junctions can be configured as low-energy X-ray spectrometers. We present results obtained when low-energy X-rays are absorbed in niobium films coupled to aluminum layers that serve as quasiparticle traps in an Nb/Al/Al_2O_3/Al/Nb tunnel junction X-ray detector. The linearity of the pulse height as a function of energy is discussed along with the energy dependence of the observed resolution and its relation to the broadening mechanisms. A resolution of 14 eV at 1 keV has been measured with our detector cooled to 0.3 K.

22108 (UCRL-JC–119293) **Non-equilibrium dynamics in superconducting tunnel junction detectors.** Hiller, L.J. (Argonne National Lab., IL (United States)); Labov, S.E.; Mears, C.A.; Frank, M.; Bello, A.F.; Barfknecht, A.T. Lawrence Livermore National Lab., CA (United States). 9 Dec 1994. 13p. Sponsored by USDOE, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-48. Contract NAS5-38013; Grant NAGW-3907. (CONF-940723–41: Annual meeting of the Society of Photo-Optical Instrumentation Engineers, San Diego, CA (United States), 24-29 Jul 1994). Order Number DE95011734. Source: OSTI; NTIS; GPO Dep.

Superconducting tunnel junctions have the potential to serve as high-resolution, high-efficiency x-ray detectors for astrophysical and industrial applications. When irradiated by X rays, each X ray excites over 10^6 charge carriers which cause the detector to generate a pulse of current. We present an analysis of pulse shapes from detectors we have constructed and operated. We fit the decay of the current pulse to a simple model that considers two classes of carrier loss. One model considers only the normal recombination of the charge carriers with themselves, the other included additional losses due to recombination sites in the within the detector medium. We found that both mechanisms most be taken into account. We also found a small variation in pulse shape depending on which layer of the tunnel junction absorbed the X ray. We expect that this analysis will be a useful tool in comparing different detector designs and operating conditions.

22109 (VAEC-B–025) **On the second kinetic order thermoluminescent glow curves.** Dang Thanh Luong (Institute of Nuclear Science and Technology, Hanoi (Viet Nam)); Nguyen Hao Quang; Hoang Minh Giang. Viet Nam National Atomic Energy Commission, Ha Noi (Viet Nam). 1995. 10p. R-project 324. Order Number DE95632449. Source: OSTI; NTIS (US Sales Only); INIS.

The kinetic parameters of thermoluminescent material such as CaF_2-N and $CaSO_4$-Dy with the different grain sizes are investigated in detail using the least square method of fitting. It was found that the activation energy E (or trap depth) and peak temperature T_max are changed with the elapsed time between the irradiation and read-out for the low temperature glow curve peaks.

The similar TL glow curve shapes are obtained for the different $CaSO_4$-Dy grain size. (author). 7 refs., 5 figs., 2 tabs.

22110 (VAEC-E–026) **Silver dichromate - a suitable dosimeter for radiation processing.** Hoang Hoa Mai (Institute of Nuclear Science and Technology, Hanoi (Viet Nam)); Nguyen Dinh Duong. Viet Nam National Atomic Energy Commission, Ha Noi (Viet Nam). 1995. 13p. Order Number DE95632450. Source: OSTI; NTIS (US Sales Only); INIS.

An aqueous dosimeter system based on solution of silver dichromate in perchloric acid and spectrophotometry analysis was investigated. The optical absorption characteristics of solutions have been studied. The molar extinction coefficients and radiation-yield of the dosimeter solutions were determined. The mechanism of radiation-induced reactions in the solutions is also considered. A formula for calculating the dose based on absorbance measurements is presented. The G-value of dichromate reduction caused by gamma radiation was determined. The value found, 0.397 is close to the values of the other authors. Two solutions with different concentrations of dichromate have been chosen to match two applicable dose ranges. The solution containing 0.5 mM $Ag_2Cr_2O_7$ in 0.1 M $HClO_4$ is applied to dose range of 1 -12 kGy and the solution with 0.5 mM $Ag_2Cr_2O_7$ and 2.00 mM $K_2Cr_2O_7$ in 0.1 M $HClO_4$ is applied to dose range of 3 to 50 kGy. It was found that the relationship between net absorbance ΔA and radiation dose, D is essentially linear over expected dose ranges. The calibration curves have been drawn up by using least square method. In routine use for gamma radiation the dosimeter show good accuracy, reproducibility and stability of the response. (author). 10 refs., 4 figs., 3 tabs.

22111 (CONF-941144–156) **Fabrication of optical channel waveguides in the GaAs/AlGaAs system by MeV ion beam bombardment.** Taylor, T. (Alabama A and M Univ., Normal, AL (United States). Dept. of Physics); Ila, D.; Zimmerman, R.L.; Ashley, P.R.; Poker, D.B. Oak Ridge National Lab., TN (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC05-84OR21400. G rii880291. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95008973. Source: OSTI; NTIS; GPO Dep.

We have fabricated optical channel waveguides in planar GaAs/AlGaAs waveguides using 10 MeV oxygen ions at a fluence of 3×10^{13} and 3×10^{14} ions/cm^2. Although disordering o GaAs/AlGaAs quantum well structures has previously been reported, to the best of the authors' knowledge the fabrication of channel waveguides using high energy oxygen bombardment has not been demonstrated in this material system. This technique may provide a totally new concept of localized material modifications in GaAs/AlGaAs waveguides by creating compositional disordered regions that act as optical confinement channels. The masking technique used to provide selective disordering of the planar waveguide structures will be presented. Optical measurements were performed on the channel waveguides at a wavelength of 1.3 μm.

22112 (LBL–36845) **Quantum mechanical capacitance in a scanning tunneling microscope.** Botkin, D.; Weiss, S.; Ogletree, D.F.; Salmeron, M.; Chemla, D.S. Lawrence Berkeley Lab., CA (United States). Feb 1995. 7p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC03-76SF00098. # N000-14.93.105.36. (CONF-9503146–1: Ultrafast electronics and optoelectronics symposium, Dana Point, CA (United States), Mar 1995). Order Number DE95011272. Source: OSTI; NTIS; GPO Dep.

The nature of the ultrafast response of the tunnel junction in a scanning tunneling microscope is discussed.

22113 (SAND–94-2002C) **Laser beaming demonstrations at the Starfire Optical Range.** Lipinski, R.J. (Sandia National Labs., Albuquerque, NM (United States)); Meister, D.C.; Tucker, S.; Leatherman, P.; Fugate, R.Q.; Maes, C.; Lange, W.J.; Cowan, W.; Cleis, R.A.; Spinhirne, J.M. Sandia National Labs., Albuquerque, NM (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950226–43: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-14 Feb 1995). Order Number DE95007747. Source: OSTI; NTIS; GPO Dep.

The ability to acquire, track, and accurately direct a laser beam to a satellite is crucial for power-beaming and laser-communications. To assess the state of the art in this area, a team consisting of Air Force Phillips Laboratory, Sandia National Laboratories, and COMSAT Corporation personnel performed some laser beaming demonstrations to various satellites. A ruby laser and a frequency-doubled YAG laser were used with the Phillips Lab Starfire Optical Range (SOR) beam director for this activity. The ruby laser projected 20 J in 6 ms out the telescope with a beam divergence that increased from 1.4 to 4 times the diffraction limit during that time. The doubled YAG projected 0.09 J in 10 ns at 20 Hz. The SOR team demonstrated the ability to move rapidly to a satellite, center it in the telescope, then lock onto it with the tracker, and establish illumination. Several low-earth-orbit satellites with corner-cube retro-reflectors were illuminated at ranges from 1000 to 6000 km with a beam divergence estimated to be about 20 μradians. The return signal from the ruby laser was collected in a 15-cm telescope, detected by a photomultiplier tube, and recorded at 400 kHz. Rapid variations in intensity (as short at 15 μs) were noted, which may be due to speckles caused by phase interference from light reflected from different retro-reflectors on the satellite. The return light from the YAG was collected by a 35-cm telescope and detected by an intensified CCD camera. The satellite brightened by about a factor of 30 in the sunlight when the laser was turned on, and dimmed back to normal when the 50-μradian point-ahead was turned off. The satellite was illuminated at 1 Hz as it entered the earth's shadow and followed for about 10 seconds in the shadow. In another demonstration, four neighboring GEO satellites were located and centered in succession with a 3.5-m telescope at a rate of about 16 seconds per satellite.

22114 (UCRL-JC–116858) **Feasibility of fullerene thin films for high-speed all-optical switching.** Lee, H.W.H.; Hughes, R.S. Jr.; Davis, J.E.; MConaghy, C.F.; Hamza, A.V.; Balooch, M. Lawrence Livermore National Lab., CA (United States). May 1994. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940582–8: CLEO '94: conference on lasers and electro-optics, Anaheim, CA (United States), 8-13 May 1994). Order Number DE95011735. Source: OSTI; NTIS; GPO Dep.

We measured the optical nonlinearity of fullerene thin films (C_{60},C_{70}) from 710–850 nm and determined the figure of merit for all-optical switching. We also demonstrated, to our knowledge, the first fullerene-based all-optical switch.

22115 (UCRL-JC–119064) **Beryllium based multilayers for normal incidence extreme ultraviolet reflectance.** Skulina, K. (Lawrence Livermore National Lab., CA (United States)); Alford, C.; Bionta, R.; Makowiecki, D.; Gullikson, E.; Soufli, R.; Kortright, J.; Underwood, J. Lawrence Livermore National Lab., CA (United States). Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9409177–7: Optical Society of America conference on extreme ultraviolet lithography, Monterey, CA (United States), 19-21 Sep 1994). Order Number DE95011760. Source: OSTI; NTIS; GPO Dep.

We report the experimental results of beryllium based multilayer mirrors for use in the 11.4 nm region. Mirrors using molybdenum

as the high-Z material have demonstrated 68.7% peak reflectance at 11.3 nm.

22116 (UCRL-JC–120534) **Underwater laser imaging system (UWLIS).** DeLong, M.L. (Lawrence Livermore National Lab., CA (United States)); Kulp, T.J. Lawrence Livermore National Lab., CA (United States). 10 Mar 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9504154–2: Symposium on autonomous vehicles in mine countermeasures, Monterey, CA (United States), 3-7 Apr 1995). Order Number DE95011759. Source: OSTI; NTIS; GPO Dep.

Practical limitations of underwater imaging systems are reached when the noise in the back scattered radiation generated in the water between the imaging system and the target obscures the spatial contrast and the resolution necessary for target discovery and identification. The advent of high power lasers operating in the oceanic transmission window of the visible spectrum (blue-green portion) has led to improved experimental illumination systems for underwater imaging The properties of laser bearm in range-gated and synchronously scanned devices take advantage of the unique temporal and spatial coherence effect of common volume back scatter to reduce or eliminate noise, increase signal to noise levels. Synchronously scanned systems rely on the highly collimated nature of the laser beam for spatial rejection of common volume back scatter. A synchronous, raster-scanning underwater laser imaging system (UWLIS) has been developed at Lawrence liver-more National Laboratory. The present UWLIS system differs from earlier synchronous scanners in its ability to scan in two dimensions at conventional video frame rate (30 Hz). The imaging performance of the present UWLIS was measured at distances of up to 6.3 AL (at a physical distance of 15.2 meters) during an in-water tank test and 4.5 to 5.0 AL (at a physical distance of 30 meters) during open water oceanic testing. The test results indicate that the UWLIS system is already capable of extending the underwater imaging range beyond that of conventional floodlight illuminated SIT cameras. The real or near real time frame rates of the UWLIS make possible operations in a mode in which the platform speed is randomly varied. This is typical of the operational environment in which the platform is often maneuvered above and around rugged seafloor terrain's and obstacles.

22117 (UCRL-JC–119287) **A low diffraction beam technique for scanning in the shallow ocean.** Lewis, D.K. Lawrence Livermore National Lab., CA (United States). 1 Dec 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9406241–2: Inversion methods in ocean and seismic acoustics conference, La Spezia (Italy), 27 Jun 1994). Order Number DE95011742. Source: OSTI; NTIS; GPO Dep.

The Localized Wave pulse project has created the concept of highly localized, pulsed wave energy. We have confirmed, and developed the technique in a series of experimental and numerical tests. This technique generates radiation, mechanical or electromagnetic, from an array. LW generation sends a broad frequency bandwidth pulse of energy along the array axis. The pulse has no sidelobes and maintains the frequency bandwidth and pulse amplitude better than any other method proposed to date. Confirmation of the theory by acoustic experiments show that the effect is real, and that the advantages of the technique can be realized in a laboratory environment. Numerical studies have shown that this effect is extendible to the microwave (vector field) and elastodynamic (tensor field) regimes as well as the stratified ocean environment. The main features of the LW beam are (1) the pulses are broad bandwidth and maintain that bandwidth over their entire working range; (2) the beam generates no side lobes; (3) the LW effect is accomplished in the linear regime, so that small errors in beam generation result in a less effective beam not the loss of the effect; and (4) the beam can be generated using present technology in the acoustic realm. The LW beam has a wide range of applications. As an active source, it offers a unique method of variable beam forming from spatially wide to the narrowest possible beam. Its uses include oceanographic sound velocity profile estimation and attenuation measurements. Since the pulse characteristics are changeable through the source signal parameters, it also offers the possibility of adaptive beam forming in real time. Passively, the LW array can use a wide spatial width listening pattern until something of interest occurs. Instantaneously, the listening pattern could be changed to a very narrow, steerable beam with a broad bandwidth. These uses also apply in the electromagnetic realm.

22118 (LBL–34503) **Scanning tunneling microscopy tip-dependent image contrast of S/Pt(111) by controlled atom transfer.** McIntyre, B.J. (Lawrence Berkeley Lab., CA (United States)); Dunphy, J.C.; Salmeron, M.; Somorjai, G.A.; Sautet, P. Lawrence Berkeley Lab., CA (United States). Oct 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9308266–1: International conference on scanning tunneling microscopy, Beijing (China), 9-14 Aug 1993). Order Number DE95011280. Source: OSTI; NTIS; GPO Dep.

Sudden changes in the detailed appearance and corrugation of atomic-resolution scanning tunneling microscopy (STM) images are commonly observed. In particular, these effects for the Pt(111)($\sqrt{3} \times \sqrt{3}$)R30°-sulfur structure have been studied. Corrugation changes have been investigated by the controlled transfer of atoms between tip and sample. Theoretical images simulations using electron scattering quantum chemical methods show that the image contrast is strongly dependent on the chemical identity of the STM tip atom. Observed changes in the sulfur images can be explained by changes from platinum-terminated to sulfur-terminated STM tips.

22119 (PNL–10421) **Meier associates and Pacific Northwest Laboratory staff exchange: Transfer of corrosion monitoring expertise to assess and develop in-line inspection tools for corrosion control.** Olson, N.J. (Pacific Northwest Lab., Richland, WA (United States)); Meier, T.E. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95011671. Source: OSTI; NTIS; GPO Dep.

Staff exchanges, such as the one described in this report, are intended to facilitate communication and collaboration among scientists and engineers at DOE laboratories, in US industry, and academia. During the past 5 years, PNL has developed prototype instrumentation to automate the data collection required for electrochemical determination of corrosion rates and behavior of materials in various electrically conductive environments. The last version is labeled the Sentry 100 prototype corrosion data scanner. Applications include these in the pulp and paper industry and at hazardous waste sites.

22120 (SAND–95-0854C) **Self-consistent temperature compensation for resonant sensors with application to quartz bulk acoustic wave chemical sensors.** Smith, J.H. (Sandia National Labs., Albuquerque, NM (United States)); Senturia, S.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950650–3: 8. international conference on solid-state sensors and actuators and 9th biannual international conference and annual European conference on solid-state sensors, Stockholm (Sweden), 25-29 Jun 1995). Order Number DE95011882. Source: OSTI; NTIS; GPO Dep.

Since resonant sensors have a temperature sensitivity which is often greater than their sensitivity to the phenomena they are being used to detect, it is imperative to include either temperature control or temperature compensation in any resonant sensor system. The authors have developed a temperature-compensation scheme for resonant sensors which is amenable to integration into a resonator-driver integrated circuit. An integrated circuit incorporating this scheme has been designed, built, and tested.

22121 (SAND–95-1144C) **Sensing liquid properties with shear-mode resonator sensors.** Martin, S.J. (Sandia National Labs., Albuquerque, NM (United States)); Cernosek, R.W.; Spates, J.J. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506192–2: Transducers '95, Stockholm (Sweden), 25-29 Jun 1995). Order Number DE95013554. Source: OSTI; NTIS; GPO Dep.

Liquid properties are measured from the changes they induce in the resonant frequency and damping of thicknessshear mode quartz resonators. A smooth-surfaced resonator viscously entrains the contacting fluid and responds to the density-viscosity product. Separation of density and viscosity is accomplished using two devices: one with a smooth surface and one with a corrugated surface that traps fluid. By observing the difference in stored and dissipated energies in the contacting fluid, its non-Newtonian characteristics can also be determined.

22122 (SAND–95-0453C) **Fusion of LADAR with SAR for precision strike.** Cress, D.H.; Muguira, M.R. Sandia National Labs., Albuquerque, NM (United States). Mar 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503155–1: 8. national symposium on sensor fusion, Dallas, TX (United States), 15-17 Mar 1995). Order Number DE95012225. Source: OSTI; NTIS; GPO Dep.

This paper presents a concept for fusing 3-dimensional image reconnaissance data with LADAR imagery for aim point refinement. The approach is applicable to fixed or quasi-fixed targets. Quasi-fixed targets are targets that are not expected to be moved between the time of reconnaissance and the time of target engagement. The 3-dimensional image data is presumed to come from standoff reconnaissance assets tens to hundreds of kilometers from the target area or acquisitions prior to hostilities. Examples are synthetic aperture radar (SAR) or stereoprocessed satellite imagery. SAR can be used to generate a 3-dimensional map of the surface through processing of data acquired with conventional SAR acquired using two closely spaced, parallel reconnaissance paths, either airborne or satellite based. Alternatively, a specialized airborne SAR having two receiving antennas may be used for data acquisition. The data sets used in this analysis are: (1) LADAR data acquired using a Hughes-Danbury system flown over a portion of Kirtland AFB during the period September 15–16, 1993; (2) two pass interferometric SAR data flown over a terrain-dominated area of Kirtland AFB; (3) 3-dimensional mapping of an urban-dominated area of the Sandia National Laboratories and adjacent cultural area extracted from aerial photography by Vexcel Corporation; (4) LADAR data acquired at Eglin AFB under Wright Laboratory's Advanced Technology Ladar System (ATLAS) program using a 60 μJ, 75 KHz Co_2 laser; and (5) two pass interferometric SAR data generated by Sandia's STRIP DCS (Data Collection System) radar corresponding to the ATLAS LADAR data. The cultural data set was used in the urban area rather than SAR because high quality interferometric SAR data were not available for the urban-type area.

22123 (UCRL-ID–119197) **Loch Linnhe '94: Test operations description and on-site analysis, US activities.** Mantrom, D.D. Lawrence Livermore National Lab., CA (United States). Nov 1994. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011700. Source: OSTI; NTIS; GPO Dep.

A field experiment named Loch Linnhe '94 (LL94) is described. This experiment was conducted in upper Loch Linnhe, Scotland, in September 1994, as an exercise involving UK and US investigators, under the Joint UK/US Radar Ocean Imaging Program. This experiment involved a dual-frequency, dual-polarization hillside real aperture radar operated by the UK, Lawrence Livermore National Laboratory's (LLNL) current meter array (CMA), in-water hydrodynamic sensors, and meteorological measurements. The primary measurements involved imaging ship-generated and ambient internal waves by the radar and the CMA. This report documents test operations from a US perspective and presents on-site analysis results derived by US investigators. The rationale underlying complementary radar and C@ measurements is described. Descriptions of the test site, platforms, and major US instrument systems are given. A summary of test operations and examples of radar, CMA, water column profile, and meteorological data are provided. A description of the rather extensive analysis of these data performed at the LL94 test site is presented. The products of this analysis are presented and some implications for further analysis and future experiments are discussed. All experimental objectives were either fully or partially met. Powerful on-site analysis capabilities generated many useful products and helped improve subsequent data collection. Significant further data analysis is planned.

4501 Chemical Explosions and Explosives

22124 (LA–12939-MS) **Formulation of non-lacquer (latex) PBX-9502.** Sadler, C.P.; Freer, J.E. Los Alamos National Lab., NM (United States). Jun 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95012141. Source: OSTI; NTIS; GPO Dep.

Waste minimization necessitates evaluation of current waste streams with regard to new processing methods and technology. PBX-9502 (95% TATB/5% Kel-F 800) uses an ethyl acetate solvent to dissolve the Kel-F 800 resin, creating a lacquer for coating TATB. This report describes a new latex polymer application method for PBX-9502, which eliminates the H_2O-to-ethyl acetate rinse-out and the resultant solvent-contaminated water waste stream and distillation air emissions.

22125 (LA-UR–95-610) **Swept frequency acoustic interferometry technique for chemical weapons verification and monitoring.** Sinha, D.N.; Anthony, B.W.; Lizon, D.C. Los Alamos National Lab., NM (United States). [1995]. 8p. Sponsored by Defense Nuclear Agency, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950163–4: 3. international on-site analysis conference, Houston, TX (United States), 22-25 Jan 1995). Order Number DE95007854. Source: OSTI; NTIS; GPO Dep.

Nondestructive evaluation (NDE) techniques are important for rapid on-site verification and monitoring of chemical munitions, such as artillery shells and bulk containers. Present NDE techniques provide only limited characterizations of such munitions. This paper describes the development of a novel noninvasive technique, swept-frequency acoustic interferometry (SFAI), that significantly enhances the capability of munitions characterizations. The SFAI technique allows very accurate and simultaneous determination of sound velocity and attenuation of chemical agents over a large frequency range inside artillery shells, in addition to determining agent density. The frequency-dependent sound velocity and attenuation can, in principle, provide molecular relaxation properties of the chemical agent. The same instrument also enables a direct fill-level measurement in bulk containers. Industrial and other applications of this general-purpose technique are also discussed.

22126 (LA-UR–95-1164) **Final report on the oxidation of energetic materials in supercritical water. Final Air Force report.** Buelow, S.J. (and others); Allen, D.; Anderson, G.K. Los Alamos National Lab., NM (United States). 3 Apr 1995. 222p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95010888. Source: OSTI; NTIS; GPO Dep.

The objective of this project was to determine the suitability of oxidation in supercritical fluids (SCO), particularly water (SCWO), for disposal of propellants, explosives, and pyrotechnics (PEPs). The SCO studies of PEPs addressed the following issues: The efficiency of destruction of the substrate. The products of destruction contained in the effluents. Whether the process can be conducted safely on a large scale. Whether energy recovery from the process is economically practicable. The information essential for process

development and equipment design was also investigated, including issues such as practical throughput of explosives through a SCWO reactor, reactor materials and corrosion, and models for process design and optimization.

22127 (SAND–94-0774) **Prompt laser ignition and transition to detonation in a secondary explosive.** Setchell, R.E.; Trott, W.M. Sandia National Labs., Albuquerque, NM (United States). May 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95012115. Source: OSTI; NTIS; GPO Dep.

A two-stage approach to achieving detonation in a secondary explosive was developed in previous studies in which ignition resulted from low-energy hot wires or from laser diodes. In the current study, this approach was examined in some detail for the case of ignition by a pulsed, solid-state (rod) laser. An initial series of experiments used Nd/glass, Nd/YAG, and Ti/sapphire lasers to investigate the ignition of graphite-doped HMX in highly confined optical fixtures that incorporated a fast piezoelectric pressure transducer. Experimental parameters included the laser power history and the explosive column length. The results of these experiments guided a second series of experiments in which the ignition column explosive was terminated by a thin rupture disc in contact with a transition column of low-density HMX or some other material. The transition column was terminated with a piezoelectric time-of-arrival detector for determining overall function times. Parameters investigated included different laser sources, rupture disc thicknesses, and the transition column explosive characteristics. Overall function times less than 50 microseconds were obtained, and trends established by the various parameter studies indicate that further reductions in function time can be achieved.

22128 (SAND–94-2787C) **Development and production of two explosive components using SCB technology.** Tarbell, W.W. (Sandia National Labs., Albuquerque, NM (United States)); Sanchez, D.H.; Oestreich, M.L.; Prentice, J.W. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950720–3: AIAA/SAE/ASME joint propulsion conference and exhibit, San Diego, CA (United States), 10-12 Jul 1995). Order Number DE95011875. Source: OSTI; NTIS; GPO Dep.

For many years, explosive components have used hotwires to convert an electrical stimulus into the thermal energy required to initiate the device. A Semi-Conductor Bridge (SCB) performs the same function, but with the advantage of requiring approximately 1/10 the input energy of a comparable hotwire, while retaining excellent no-fire characteristics. The SCB also demonstrates faster function times due to its inherently-lower thermal mass. This paper discusses the development and production of two SCB-based devices, the MC4491 Initiator and the MC4492 Actuator. The initiator is designed to shock initiate a linear shaped charge by accelerating a thin metal plate across a small gap. The actuator functions several different components, serving as either an actuator by producing a rapidly expanding gas to activate piston mechanisms or as an ignitor by providing hot particles for initiating pyrotechnic mixtures. Details are provided on the construction of both devices, methods of assembly, and performance characteristics (function time, flyer velocity, pressure in a closed bomb, heat content, and no-fire and all-fire levels).

22129 (SAND–94-2862C) **Performance characterization of the NASA standard detonator.** Tarbell, W.W. (Sandia National Labs., Albuquerque, NM (United States)); Burke, T.L.; Solomon, S.E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950720–4: AIAA/SAE/ASME joint propulsion conference and exhibit, San Diego, CA (United States), 10-12 Jul 1995). Order Number DE95011876. Source: OSTI; NTIS; GPO Dep.

The NASA Standard Detonator (NSD) is employed in support of a number of current applications, including the Space Shuttle. This effort was directed towards providing test results to characterize the output of this device for its use in a safe and arm device. As part of the investigation, flash X-ray was used to provide stop-motion photographs of the flying metal plate that is created by initiation of the detonator. This provided researchers with a better understanding of the shape and character of the high-velocity disk as it propagated across the gap between the detonator and next assembly. The second portion of the study used a velocity interferometer to evaluate the acceleration and velocity histories of the flying plate, providing a quantified assessment of the detonator's ability to initiate the explosive in the next explosive.

22130 (SAND–95-8587C) **Reapplication of energetic materials at fuels.** Baxter, L. (Sandia National Labs., Livermore, CA (United States)); Sinquefield, S.; Huey, S.; Lipkin, J.; Shah, D.; Ross, J.; Sclippa, G.; Davis, K. Sandia National Labs., Livermore, CA (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9504163–2: Combustion Institute and American Flame Research onference, San Antonio, TX (United States), 23-26 Apr 1995). Order Number DE95011409. Source: OSTI; NTIS; GPO Dep.

This investigation addresses the combustion-related aspects of the reapplication of energetic materials as fuels in boilers as an economically viable and environmentally acceptable use of excess energetic materials. The economics of this approach indicate that the revenues from power generation and chemical recovery approximately equal the costs of boiler modification and changes in operation. The primary tradeoff is the cost of desensitizing the fuels against the cost of open burn/open detonation (OB/OD) or other disposal techniques. Two principal combustion-related obstacles to the use of energetic-material-derived fuels are NO_x generation and the behavior of metals. NO_x measurements obtained in this investigation indicate that the nitrated components (nitrocellulose, nitroglycerin, etc.) of energetic materials decompose with NO_x as the primary product. This can lead to high uncontrolled NO_x levels (as high as 2600 ppm on a 3% O_2 basis for a 5% blend of energetic material in the fuel). NO_x levels are sensitive to local stoichiometry and temperature. The observed trends resemble those common during the combustion of other nitrogen containing fuels. Implications for NO_x control strategies are discussed. The behavior of inorganic components in energetic materials tested in this investigation could lead to boiler maintenance problems such as deposition, grate failure, and bed agglomeration. The root cause of the problem is the potentially extreme temperature generated during metal combustion. Implications for furnace selection and operation are discussed.

22131 (UCRL-ID–118353) **Reynolds Industries Systems Inc. SQ-80 ignitor performance characterization.** Cutting, J.L.; Lee, R.S. Lawrence Livermore National Lab., CA (United States). Jul 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95014456. Source: OSTI; NTIS; GPO Dep.

RISI SQ-80 ignitor is a thermite filled exploding bridgewire ignitor. Eleven shots were fired. Film development time was the major time problem. Other problems also existed. These EBW ignitors should enhance safety in igniting rocket propellant. 11 figs.

22132 (UCRL-ID–119672) **Characterization of TNAZ.** Simpson, R.L.; Garza, R.G.; Foltz, M.F.; Ornellas, D.L.; Utriew, P.A. Lawrence Livermore National Lab., CA (United States). 14 Dec 1994. 12p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011524. Source: OSTI; NTIS; GPO Dep.

The explosive TNAZ has recently become available in pilot-plant quantities. We have found its small-scale safety properties similar to those of other nitramines. Detonation calorimetry showed TNAZ to have 96% the energy of HMX and 150% of TNT. The shock sensitivity of neat TNAZ is greater than LX-14. A retonation wave was observed when the material was shocked at 2.0 GPa. The initiation behavior of neat TNAZ cannot be classified as either homogeneous or heterogeneous. Six plastic bonded TNAZ-based explosives have been developed for the Army.

22133 (UCRL-ID–120479) **CIST....CORRTEX interferometer simulation test.** Heinle, R.A. Lawrence Livermore National Lab., CA (United States). Dec 1994. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011427. Source: OSTI; NTIS; GPO Dep.

Testing was performed in order to validate and cross calibrate an RF interferometer and the crush threshold of cable. Nitromethane was exploded (inside of PVC pipe). The explosion was used to crush the interferometer sensor cables which had been placed inside and outside the pipe. Results are described.

22134 (UCRL-ID–120838) **Factors affecting the erosion of jets penetrating high explosive.** Haselman, L.C.; Winer, K.A. Lawrence Livermore National Lab., CA (United States). 1 May 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013296. Source: OSTI; NTIS; GPO Dep.

It has been observed in various experiments with shaped charge jets penetrating high explosives that the erosion of the jet can be considerably greater than that expected from analytical theory or from two dimensional hydrodynamic computer simulations. In a previous study, we found that the initial penetration of the jet agreed with theory, and that the erosion of the jet happened subsequent to the initial penetration. This additional erosion can be the dominant factor in the total length of jet that is eroded. We also found that in one experiment the jet did not show any excess erosion and that the penetration could be predicted from theory. We also found a rough correlation of the amount of excess erosion with the diameter of the jet, with larger jet diameters giving less erosion. A problem with previous experiments was that a wide variety of shaped charges, target shapes, and target thicknesses were used. This made it difficult to isolate the effect of a particular parameter. For the current study we chose to isolate the effects of scale and target thickness. For this purpose we used well characterized jets and carefully chosen targets. We also did computer calculations to help elucidate the underlying mechanisms of the excess erosion.

22135 (UCRL-JC–117805) **Temperature-dependent shock initiation of LX-17 explosive.** Lee, R.S.; Chau, H.H.; Druce, R.L.; Moua, K. Lawrence Livermore National Lab., CA (United States). Feb 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9506142–2: 4. international symposium on behavior of dense media under high dynamic pressure, Tours (France), 5-9 Jun 1995). Order Number DE95012475. Source: OSTI; NTIS; GPO Dep.

LX-17 samples, heated to temperatures up to 250 C, were impacted by 3 to 10-mm-wide, 50.8-mm-long strips of 0.13-mm-thick Kapton polyimide film at velocities up to 7.7 km/s. The Kapton strips were laminated onto a thin aluminum bridge foil and were launched to the desired velocity by discharging a capacitor bank through the foil, causing the foil to explode. The LX-17 samples were confined in a steel holder and heated in an oven to the desired temperature. After the capacitor bank was charged, the LX-17 sample in its steel holder was remotely drawn out of the oven on rails and positioned over the bridge-foil/Kapton-strip laminate. When the sample was in position, the bank was discharged, launching the Kapton strip against the LX-17 surface. The shock initiation threshold was measured for 3, 7, and 10-mm-wide strips at room temperature, 200 C and 250 C. The authors found a significant reduction in the velocity threshold and in the critical area for initiation when the samples were heated. The authors compare the results with the earlier data of Bloom, who measured the initiation threshold of LX-17 over the density range 1.8–1.91 g/cm^3 at room temperature and −54 C. LX-17 has a large coefficient of thermal expansion, as reported by Urtiew, et al., which reduces its density significantly t elevated temperatures. They find that the change of shock initiation threshold with temperature is consistent with the change in sample density, using the relation between threshold and density reported by Bloom.

22136 (UCRL-JC–119069) **Buried mine detection using ground-penetrating impulse radar.** Sargis, P.D. Lawrence Livermore National Lab., CA (United States). Mar 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9504154–1: Symposium on autonomous vehicles in mine countermeasures, Monterey, CA (United States), 3-7 Apr 1995). Order Number DE95011443. Source: OSTI; NTIS; GPO Dep.

LLNL is developing a side-looking, ground-penetrating impulse radar system that can eventually be mounted on a robotic vehicle or an airborne platform to locate buried land mines. The system is described and results from field experiments are presented.

22137 (UCRL-JC–119203) **Particulation in jets from free-form hemispherical shaped charges with copper liners.** Simonson, S.C. III; Haselman, L.C. Jr.; Breithaupt, R.D. Lawrence Livermore National Lab., CA (United States). May 1995. 8p. Sponsored by Department of Defense, Washington, DC (United States);USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9505229–1: 45. annual bomb and warhead technical symposium, Huntsville, AL (United States), 16-17 May 1995). Order Number DE95014455. Source: OSTI; NTIS; GPO Dep.

Particulation in free-form hemispherical shaped charge jets is considerably different from that in conical shaped charge jets. From the analysis of the particulation data for 23 experiments covering ten free-form hemi designs with copper liners, it is concluded that jets with higher convergence pressures have delayed particulation, sometimes by as much as a factor of two. Breakup is also found to be design dependent, with free-form hemis have delayed breakup compared with cones. Also, in going from the earlier, boat-tail high explosive (HE) designs to later, more efficient hemispherical HE designs, it is found that particulation is delayed in the tail of the jet. These effects indicate the potential for deeper armor penetration based on control of particulation.

22138 (UCRL-ID–120477) **KAWICH-A: Containment data report.** Heinle, R.; Stubbs, T. Lawrence Livermore National Lab., CA (United States). Aug 1994. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011426. Source: OSTI; NTIS; GPO Dep.

This report briefly describes the KAWICH-A event, containment, and measuring instruments utilized. Diagrams are presented on pressure and radiation histories, containment instrumentation plan, and sanded gypsum emplacement.

22139 (UCRL-ID–120478) **NORMANNA containment data report.** Hudson, B.; Stubbs, T.; Heinle, R. Lawrence Livermore National Lab., CA (United States). Mar 1995. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95011512. Source: OSTI; NTIS; GPO Dep.

The second in a series of three similar experiments, NORMANNA was located in hole U10cb in area 10 of the Nevada Test Site (NTS). The first experiment of this series (JARLSBERG) was conducted about one year earlier. The diameter of the emplacement hole was 2.18 m and the depth-of-burial of 203 m placed the working point in alluvium about 100 m above the Paleozoic contact and nearly 300 m above the static water level. NORMANNA was detonated on July 12, 1984 at 07:00 PDT. All phenomena appeared normal with a chimney collapse to the ground surface about 7 minutes later. The mean radius of the resulting crater was 54.1 m and its maximum depth was 8.8 m. No radiation arrivals were detected above ground and containment was satisfactory.

22140 (UCRL-ID–120480) **PANAMINT: Containment data report.** Hudson, B.; Stubbs, T.; Heinle, R. Lawrence Livermore National Lab., CA (United States). Mar 1995. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011422. Source: OSTI; NTIS; GPO Dep.

The PANAMINT event was detonated in hole U2gb of the Nevada Test Site at 13:59 PDT on May 21, 1986. This paper contains a discussion of that event, with special attention given to the instrumentation designed to monitor stemming emplacement and performance. Data from those instruments are presented.

22141 (UCRL-ID–120567) **LLNL review of the 1994 accelerator production of tritium (APT) concept.** Alesso, H.P. (and others); Barnard, J.J.; Booth, R. Lawrence Livermore National Lab., CA (United States). 8 Mar 1995. 38p. Sponsored by USDOE,

Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012260. Source: OSTI; NTIS; GPO Dep.

LLNL was asked in September 1994 to review the accelerator production of tritium (APT) concept as it had evolved up to the fall of 1994. The purpose was not to compare it to other sources of tritium, but to identify possible technical flaws in the concept and to assess feasibility. The APT concept reviewed was based on a 1.0 GeV normal conducting proton linac operating CW at currents up to 200 mA with a target of tungsten and blanket of ^{3}He and lead. The LLNL review group concurs with the conclusions of four previous reviews (1989 to 1994) that this concept can meet the tritium requirements of a reduced stockpile of approximately 3,500 ± 1,500 warheads. The authors believe that the predicted tritium production rate is based on sound nuclear and transport models and that the schedules for technology demonstrations, design, and construction are realistic. They conclude that the technical risk of the concept is low and can be managed within the risk reduction program. The risk reduction program should focus on risk to the schedule and on cost reduction.

22142 (UCRL-ID–120650) **ORKNEY: Containment data report.** Heinle, R.; Hudson, B.; Stubbs, T. Lawrence Livermore National Lab., CA (United States). Mar 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011423. Source: OSTI; NTIS; GPO Dep.

The ORKNEY event was detonated in hole U10be of the Nevada Test Site at 6:50 PST on May 2, 1984. This paper contains a discussion of that event, with special attention given to the instrumentation for monitoring stemming emplacement and performance of the event. Data from these instruments are presented.

22143 (UCRL-ID–120651) **BRIE containment data report.** Hudson, B.; Stubbs, T.; Heinle, R. Lawrence Livermore National Lab., CA (United States). Mar 1995. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011526. Source: OSTI; NTIS; GPO Dep.

The third in a series of experiments in close proximity, BRIE was located in hole U10cc in area 10 of the Nevada Test Site (NTS). The first experiment (JARLSBERG) was conducted about four years earlier while the second experiment (NORMANNA) was detonated about three years earlier. The diameter of the emplacement hole was 2.18 m and the depth-of-burial of 203 m placed the working point in alluvium about 100 m above the Paleozoic contact and nearly 300 m above the static water level. BRIE was detonated on June 18, 1987, at 08:20 PDT. All phenomena appeared normal with a chimney collapse broaching the ground surface about 17 minutes later. The mean radius of the resulting crater was 54.1 m and its maximum depth was 10.3 m. No radiation arrivals were detected above ground and containment was satisfactory.

22144 (UCRL-JC–118788) **Consistent finite-volume discretization of hydrodynamic conservation laws for unstructured grids.** Burton, D.E. Lawrence Livermore National Lab., CA (United States). 17 Oct 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9410254–6: Nuclear explosives code developers conference (NECDC), Las Vegas, NV (United States), 27 Oct 1994). Order Number DE95011730. Source: OSTI; NTIS; GPO Dep.

We consider the conservation properties of a staggered-grid Lagrange formulation of the hydrodynamics equations (SGH). Hydrodynamics algorithms are often formulated in a relatively ad hoc manner in which independent discretizations are proposed for mass, momentum, energy, and so forth. We show that, once discretizations for mass and momentum are stated, the remaining discretizations are very nearly uniquely determined, so there is very little latitude for variation. As has been known for some time, the kinetic energy discretization must follow directly from the momentum equation; and the internal energy must follow directly from the energy currents affecting the kinetic energy. A fundamental requirement (termed isentropicity) for numerical hydrodynamics algorithms is the ability to remain on an isentrope in the absence of heating or viscous forces and in the limit of small timesteps. We show that the requirements of energy conservation and isentropicity lead to the replacement of the usual volume calculation with a conservation integral. They further forbid the use of higher order functional representations for either velocity or stress within zones or control volumes, forcing the use of a constant stress element and a constant velocity control volume. This, in turn, causes the point and zone coordinates to formally disappear from the Cartesian formulation. The form of the work equations and the requirement for dissipation by viscous forces strongly limits the possible algebraic forms for artificial viscosity. The momentum equation and a center-of-mass definition lead directly to an angular momentum conservation law that is satisfied by the system. With a few straightforward substitutions, the Cartesian formulation can be converted to a multidimensional curvilinear one. The formulation in 2D symmetric geometry preserves rotational symmetry.

4503 Nuclear Explosion Detection

Refer also to citation(s) 21558

22145 (UCRL-CR–120949) **Comparison of the effects in the rock mass of large-scale chemical and nuclear explosions. Final technical report, June 9, 1994–October 9, 1994.** Spivak, A.A. Lawrence Livermore National Lab., CA (United States). Apr 1995. 178p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013381. Source: OSTI; NTIS; GPO Dep.

It was found that in the first approximation the mechanical effect of underground nuclear explosion is analogous to the effect of chemical explosion. Really qualitative analysis shows that accompanying mechanical effects of nuclear and chemical explosions are the same: in the both cases explosion consequences are characterized by formation of the camouplet cavity (crater after explosion near free surface), destruction of the rock massif near explosion centre, creation of the stress wave, which forms seismoexplosive effect a long distance from explosion epicentre. Qualitative likeness of underground nuclear explosions and chemical explosions is the base of modelling the mechanical effects of the underground nuclear explosion. In this paper we'll compare two explosions: nuclear (15-04-84) and chemical (27.06.95) with large power. These explosions were realized at the same geological conditions at Degelen test area, which is a part of the Semipalatinsk Test Site. In the case of the nuclear explosion, the charge was disposed in the face of the deep horizontal gallery. The charge of the chemical explosion was a semisphere from explosives at the rock massif surface. In the both case rock massif behavior after explosions was investigated at underground conditions (in the case of chemical explosion – in the long underground excavation from explosion epicentre). Mechanical effects from the nuclear and chemical explosions were investigated with the same methods. The changes in geological medium after a large-scale explosive actions will be analyzed in detail too. Investigations of the influence of tectonic energy on the mechanical effects after underground nuclear, explosions represents the main interest. In this paper we'll discuss this question on the data from underground nuclear explosion, realized 08.09.89 in the deep well at the Balapan test area, at the Semipalatinsk Test Site.

22146 (UCRL-ID–120666) **VILLE containment data report.** Stubbs, T.; Heinle, R. Lawrence Livermore National Lab., CA (United States). Mar 1995. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013272. Source: OSTI; NTIS; GPO Dep.

The VILLE event was detonated in hole U4am of the Nevada Test Site as indicated in Fig. 1.1. A plan view map of the local region around hole U4am indicating the inferred faults and drill holes is shown in figure 1.2. The device had a depth-of-burial of 293 m in the alluvium of Area 4, about 240 m above the standing water level (SWL), as shown in Figure 1.3. Stemming of the 2.44 m diameter emplacement hole followed the plan shown in Fig. 1.4. A log of the stemming operations was maintained by Holmes and Narver. Detonation time was 08:15 PDT on June 13, 1985 and about 28 minutes later the chimney collapsed to the surface leaving a crater with a mean radius of 59.7 m and a maximum depth of 17.3 m. No radiation arrivals were detected in the emplacement hole and the VILLE containment was considered successful. Three of the five stemming plugs (the first, fourth and fifth) were composed of coarse gypsum aggregate in a gypsum cement slurry.

Each of these three gypsum-filled-aggregate (GFA) plugs was monitored during emplacement with arrays of conductivity probes and thermistors. The remaining two plugs were soft, coal tar aggregate (CT/A) gas seal membranes having a thickness of about 1.5 m sandwiched between layers of fines material. A layer of CT/A was poured on the top of each of the top two GFA plugs.

4505 Strategic Defense Initiative

22147 (LA-SUB–95-14) **Criteria for choosing among competing alternatives for ATBM defenses. Final report.** Los Alamos National Lab., NM (United States); Center for Strategic and International Studies, Washington, DC (United States). [1995]. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95011621. Source: OSTI; NTIS; GPO Dep.

The Center for Strategic and International Studies (CSIS) established an executive review panel to assess the paper written by Peter Zimmerman. The panel consisted of experts on theater missile defenses, U.S. relations with former Soviet Union/Russia, the ABM compliance issues. The panel was NOT able to reach a consensus on the issues raised by the paper. NOR was it able to validate the criteria developed therein. A majority of the panel took exception to many to the facts, findings, and conclusions of the paper. The major points under dispute are: the characterization of the threat, the definition of technical risk, system performance requirements, limits on ATBM systems imposed by the ABM Treaty, Congressional views, cost and IOC dates. The issues are discussed in detail in this review.

22148 (UCRL-ID–119013) **Various ATA notes: 60, 79, 116, and 136.** Caporaso, G.; Denhoy, B.; Hanson, C.L.; Chambers, F.W. Lawrence Livermore National Lab., CA (United States). 24 Oct 1994. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012105. Source: OSTI; NTIS; GPO Dep.

The purpose of note No. 60 is to outline the reasons why it is important to develop and test a steam ejector for use on the differential pumping station. Note No. 79 discusses two stream instability of an electron beam in the differential pumped transport section. Note No. 116 covers the steam ejector prototype unit (Stage 1). And lastly, note No. 136 presents the results of a survey done to find the commercially available equipment to meet differential pump requirements for the Advanced Test Accelerator.

Argonne National Lab., IL (United States); Army Test and Evaluation Command, Dugway, UT (United States). Apr 1995. 7p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9504171–1: 21. annual environmental symposium of the American Defense Preparedness Association, San Diego, CA (United States), 18-21 Apr 1995). Order Number DE95012924. Source: OSTI; NTIS; GPO Dep.

The State of Utah has declared residues resulting from the demilitarization, treatment, cleanup, testing of military chemical agents to be hazardous wastes. These residues are listed as hazardous waste in Utah and several other States, but are not listed under regulations established by the US Environmental Protection Agency (EPA) pursuant to the Federal Resource Conservation and Recovery Act (RCRA), the primary law governing management of hazardous waste in the US These residues are identified as hazardous waste due to corrosivity, reactivity, chronic toxicity, and acute toxicity, and are designated as Hazardous Waste No. F999. The RCRA regulations (40 CFR 260-280), the Utah Administrative Code (R-315), and other State hazardous waste programs list specific wastes as hazardous, but allow generators to petition the regulator to "delist" if it can be demonstrated that such wastes are not hazardous. The US Army Test and Evaluation Command (TECOM) has initiated a project with the Argonne National Laboratory to demonstrate that certain categories of F999 residues are not hazardous waste and to achieve delisting. The initial focus is on delisting specific residues from decontamination of wastes generated during materials testing activities and contaminated soil at the US Army Dugway Proving Ground (DPG), Utah. This activity is referred to as Phase I of the delisting program. Subsequent phases of the delisting program will address additional waste streams at DPG and other Army installations. The purpose of this paper is to outline the Phase I TECOM delisting effort at DPG, identify some of the important technical issues associated with the delisting, and to discuss overall progress to date.

22150 (UCRL-ID–119330) **Energy deposition in a biological submunition warhead by low-yield nuclear interceptors.** Mendelsohn, E. Lawrence Livermore National Lab., CA (United States). Dec 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012109. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Monte Carlo calculations have been completed in which the authors exposed a model of a biological target warhead, containing 42 water-filled canisters, to the radiation output of a generic nuclear fission or fusion warhead. Water is used to simulate biological agent in aqueous solution. In the calculations this biological warhead was irradiated with a fission or a fusion point source positioned 3 meters from the target. The yield of this source was normalized to 100 tons. The resulting calculated energy depositions due to neutrons and gamma rays were tallied. A comparison is made with previous calculations using a target warhead containing a chemical agent. Tabular and graphical calculational results are provided.

22152 (ANL/DIS/CP–85637) **The Tracking and Analysis Framework (TAF): A tool for the integrated assessment of acid deposition.** Bloyd, C.N. (Argonne National Lab., IL (United States)); Henrion, M.; Marnicio, R.J. Argonne National Lab., IL (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950196–1: Air & Waste Management Association (AWMA) conference on acid rain & electric utilits: permits, allowances, monitoring & meteorology, Tempe, AZ (United States), 23-25 Jan 1995). Order Number DE95013497. Source: OSTI; NTIS; INIS; GPO Dep.

A major challenge that has faced policy makers concerned with acid deposition is obtaining an integrated view of the underlying science related to acid deposition. In response to this challenge, the US Department of Energy is sponsoring the development of an integrated Tracking and Analysis Framework (TAF) which links together the key acid deposition components of emissions, air

transport, atmospheric deposition, and aquatic effects in a single modeling structure. The goal of TAF is to integrate credible models of the scientific and technical issues into an assessment framework that can directly address key policy issues, and in doing so act as a bridge between science and policy. Key objectives of TAF are to support coordination and communication among scientific researchers; to support communications with policy makers, and to provide rapid response for analyzing newly emerging policy issues; and to provide guidance for prioritizing research programs. This paper briefly describes how TAF was formulated to meet those objectives and the underlying principals which form the basis for its development.

22153 (ANL/ER/CP–84064) **A technique using the wavelet transform to identify and isolate coherent structures in the planetary boundary layer.** Coulter, R.L. (Argonne National Lab., IL (United States)); Li, B.L. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950381–3: 11. symposium on boundary layers and turbulence, Charlotte, NC (United States), 27-31 Mar 1995). Order Number DE95011956. Source: OSTI; NTIS; GPO Dep.

A dominant feature of the convective planetary boundary layer (PBL) is the presence of coherent structures often referred to as thermal plumes. These are regions of buoyant, rising air whose maximum height is limited by the capping inversion at the top of the mixed layer. They range in diameter from 0.05 to 5 km or more, scale with the height of the mixed layer (z_i), are the large-scale source of energy input to the turbulence spectrum, and provide the mechanism for transferring energy from the surface through the mixed layer and into the capping inversion. When conditions are appropriate, fair-weather cumulus clouds develop at the tops of the thermal plumes. In this sense, small cumulus clouds provide a visual description of the size, location, and lifetime of mature, active thermal plumes in a deep mixed layer. Plume development is not limited to plumes associated with cumulus clouds. Although the horizontal pattern of thermals is often apparently randomly oriented, Ferrare et al. showed that thermals can be organized into "thermal streets," similar to cloud streets, but without clouds. The authors also used scanning lidar data to show that the horizontal cross section of thermals is roughly elliptical, with the major axis along the direction of the wind shear vector. Traveling with the mean wind, thermal plumes act as a conduit for heat and moisture between the surface and the lower troposphere. Thermal plumes can be defined either by patterns of rising air or as organized regions of enhanced "thermal turbulence" that can be depicted by large values of the temperature structure parameter, C_T^2 which can be evaluated with remote sensing instruments such as radar profilers and sodars. This more general description includes some regions of downward moving air and entrainment into the plume.

22154 (ANL/ER/CP–84065) **Surface heat flux data from energy balance Bowen ratio systems.** Wesely, M.L.; Cook, D.R.; Coulter, R.L. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9503104–2: 9. symposium on meteorological observations and instrumentation, Charlotte, NC (United States), 27-31 Mar 1995). Order Number DE95012293. Source: OSTI; NTIS; GPO Dep.

The 350 x 400 km domain of the Atmospheric Radiation Measurement (ARM) Program's Clouds and Radiation Testbed (CART) site in the southern Great Plains is equipped with 10 energy balance Bowen ratio (EBBR) stations at grassland sites; they measure the net radiation, ground heat flux, and temperature/humidity differences between 1.0 and 2.0 m heights. The latter differences provide estimates of the geometric Bowen ratio (β), which are used to estimate sensible and latent heat fluxes. This paper addresses the problem that occurs when the value of β is near -1 and to demonstrate the effectiveness of the EBBR stations in collecting energy flux data at the CART site.

22155 (ANL/ER/CP–84206) **An evaluation of ARM radiosonde operational performance.** Lesht, B.M. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9503104–3: 9. symposium on meteorological observations and instrumentation, Charlotte, NC (United States), 27-31 Mar 1995). Order Number DE95012446. Source: OSTI; NTIS; GPO Dep.

Because the ARM (Atmospheric Radiation Measurement) program uses data from radiosondes for real-time quality control and sensitive modeling applications, it is important to have a quantitative measure of the quality of the radiosonde data themselves. Two methods have been tried for estimating the quality of radiosonde data: comparisons with known standards before launch and examination of pseudo-replicate samples by single sensors aloft. The ground check procedure showed that the ARM radiosondes are within manufacturer's specifications for measuring relative humidity; procedural artifacts prevented verification for temperature. Pseudo-replicates from ascent and descent suggest that the temperature measurement is within the specified ∓ 0.2 C. On average ascent and descent data are similar, but detailed structure may be obscured on descent by loss of sampling density, and the descent involves other uncertainties.

22156 (ANL/ER/CP–84929) **Wavelet analysis of atmospheric turbulence structures: What can we gain from this new technique?.** Gao, W. (Argonne National Lab., IL (United States). Environmental Research Div.); Li, B.L. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950381–4: 11. symposium on boundary layers and turbulence, Charlotte, NC (United States), 27-31 Mar 1995). Order Number DE95011955. Source: OSTI; NTIS; GPO Dep.

The authors examined three specific methods for using the wavelet transform to derive information on the turbulence structure in the atmospheric boundary layer from raw data. The scale-time cross section method yields a qualitative picture of turbulence structures occurring at different times and different scales, the wavelet variance method provides a relatively objective estimate of principal scales associated with organized structures, and the wavelet cross correlation helps in identifying motions that are most important in turbulent transport and spatial coherence. The wavelet analysis can also be used to decompose the data for different scales and to detect coherent structures objectively by using the transform coefficient at the principal scale detected by the variance method (Collineau and Brunet, 1993; Coulter and Li, 1995). These methods can improve their capability to unfold the data for hidden information that is difficult to obtain from traditional spectral analysis and thus can provide a useful tool for understanding multiscale phenomena in the atmospheric boundary layer.

22157 (ANL/ER/CP–86004) **Using remotely sensed planetary boundary layer variables as estimates of areally averaged heat flux.** Coulter, R.L.; Martin, T.J.; Holdridge, D.J. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9503140–5: 5. atmospheric radiation measurement (ARM) meeting, San Diego, CA (United States), 20-23 Mar 1995). Order Number DE95012402. Source: OSTI; NTIS; GPO Dep.

Homogeneity across the Southern Great Plains (SGP) Cloud and Radiation Testbed (CART) site is an issue of importance to all facets of the Atmospheric Radiation Measurements (ARM) program. The degree to which measurements at the central facility can be used to verify, improve, or develop relationships in radiative flux models that are subsequently used in Global Circulation Models (GCMs), for example, is tied directly to the representativeness of the local measurements at the central facility for the site as a whole. The relative variation of surface energy budget terms over a 350- km X 400km domain such as the SGP CART site can be extremely large. The Planetary Boundary Layer (PBL) develops as a result of energy inputs from widely varying surfaces. The lower atmosphere effectively integrates the local inputs; measurements of PBL structure can potentially be used for estimates of surface heat flux over scales on the order of tens of kilometers. This project is focusing on two PBL quantities that are intimately tied to the surface heat flux: (1) the height of the mixed layer, z, that grows during daytime due to sensible heat flux input from the surface; and (2) the convective velocity scale, normally a scaling parameter defined by the product of the sensible heat flux and z, but in this

case defined by coherent structures that connect the surface layer and the capping inversion that defines z.

22158 (ANL/ER/CP–86324) **Aspects of the quality of data from SGP cart site broadband radiation sensors.** Splitt, M.E. (Oklahoma Univ., Norman, OK (United States). Cooperative Inst. for Mesoscale Meteorological Studies); Wesely, M.L. Argonne National Lab., IL (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9503140–7: 5. atmospheric radiation measurement (ARM) meeting, San Diego, CA (United States), 20-23 Mar 1995). Order Number DE95012274. Source: OSTI; NTIS; GPO Dep.

This report presents details of the performance of broadband radiometers the the southern Great Plains (SGP) cloud and radiation testbed (CART) site to estimate the uncertainties of irradiance observations. Net radiation is observed with net radiometer in the energy balance Bowen ratio station at the central facility and compared with the net radiation computed as the sum of component irradiances recorded by nearby pyranometers and pyrgeometers. This paper observes the uncertainties of readings from net radiometers which are known to be substantial.

22159 (ANL/ER/PP–85343) **Longwave radiative forcing by aqueous aerosols.** Gaffney, J.S. (Argonne National Lab., IL (United States). Environmental Research Div.); Marley, N.A. Argonne National Lab., IL (United States). Jan 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95012205. Source: OSTI; NTIS; GPO Dep.

Recently, a great deal of interest has been focused on the role of aerosols in climatic change because of their potential cooling impacts due to light scattering. Recent advances in infrared spectroscopy using cylindrical internal reflectance have allowed the longwave absorption of dissolved aerosol species and the associated liquid water to be accurately determined and evaluated. Experimental measurements using these techniques have shown that dissolved sulfate, nitrate, and numerous other aerosol species will act to cause greenhouse effects. Preliminary calculations indicate that the longwave climate forcing (i.e., heating) for sulfate aerosol will be comparable in magnitude to the cooling effect produced by light scattering. However, more detailed modeling will clearly be needed to address the impact of the longwave forcing due to aerosols as a function of atmospheric height and composition. Their work has shown that aerosol composition will be important in determining longwave forcing, while shortwave forcing will be more related to the physical size of the aerosol droplets. On the basis of these studies, it is increasingly apparent that aerosols, fogs, and clouds play a key role in determining the radiative balance of the atmosphere and in controlling regional and global climates.

22160 (ANL/ES/CP–84927) **Mobile source emission control cost-effectiveness: Issues, uncertainties, and results.** Wang, M.Q. (Argonne National Lab., IL (United States). Center for Transportation Research). Argonne National Lab., IL (United States). 1 Dec 1994. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950188–1: Reformulated fuels conference, Houston, TX (United States), 31 Jan - 2 feb 1995). Order Number DE95012215. Source: OSTI; NTIS; GPO Dep.

Emissions from mobile sources undoubtedly contribute to US urban air pollution problems. Consequently, mobile source control measures, ranging from vehicle emission standards to reducing vehicle travel, have been adopted or proposed to help attain air quality standards. To rank various mobile source control measures, various government agencies and private organizations calculate cost-effectiveness in dollars per ton of emissions reduced. Arguments for or against certain control measures are often made on the basis of the calculated cost-effectiveness. Yet, different studies may yield significantly different cost-effectiveness results, because of the various methodologies used and assumptions regarding the values of costs and emission reductions. Because of the methodological differences, the cost-effectiveness results may not be comparable between studies. Use of incomparable cost-effectiveness results may result in adoption of ineffective control measures. This paper first discusses some important methodological issues involved in cost-effectiveness calculation for mobile sources and proposes appropriate, systematic methods for dealing with these issues. Various studies have been completed recently to evaluate the cost-effectiveness of mobile source emission control measures. These studies resulted in wide variations in the cost-effectiveness for same control measures. Methodological assumptions used in each study are presented and, based on the proposed methods for cost-effectiveness calculation, adjustments are applied to the original estimates in each study to correct inappropriate methodological assumptions and to make the studies comparable. Finally, mobile source control measures are ranked on the basis of the adjusted cost-effectiveness estimates.

22161 (BNL–60197) **Comparison of seasonal and zonal patterns of the direct and indirect radiative forcing of climate by aerosols.** Wagener, R.; Schwartz, S.E. Brookhaven National Lab., Upton, NY (United States). Mar 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9503140–1: 5. atmospheric radiation measurement (ARM) meeting, San Diego, CA (United States), 20-23 Mar 1995). Order Number DE95010896. Source: OSTI; NTIS; GPO Dep.

Aerosols have a climatically significant influence on the absorption of shortwave radiant energy in the troposphere, both directly through enhanced scattering of sunlight in the absence of clouds and indirectly through their fundamental role in controlling cloud microphysical properties. Quantitative estimates of the magnitudes of both effects are very uncertain. To possibly distinguish these effects, the authors calculated the monthly and zonally averaged forcing for a spatially uniform and seasonally constant perturbation in aerosol and cloud optical properties.

22162 (BNL–61363) **Reliability, CO_2 concentration control, and CO_2 gas use of the FACE facility at ETH in 1993 and 1994.** Nagy, J. (Brookhaven National Lab., Upton, NY (United States)); Hendrey, G.R.; Lewin, K.F.; Blum, H.; Koller, S.R. Brookhaven National Lab., Upton, NY (United States). Jan 1995. 75p. Sponsored by USDOE, Washington, DC (United States);Ecole Polytechnique Federale, Lausanne (Switzerland). DOE Contract AC02-76CH00016. (CONF-950296–1: Swiss FACE meeting, Zurich (Switzerland), 2-3 Feb 1995). Order Number DE95012305. Source: OSTI; NTIS; GPO Dep.

Free-Air Carbon dioxide Enrichment (FACE) is one technique of many used to assess the effects of elevated concentrations of CO_2 on plant communities. One primary advantage of FACE techniques is that they provide fumigation over large areas under essentially normal conditions compared to other techniques such as greenhouses, open-top chambers, etc. The FACE design developed by Brookhaven National Laboratory (BNL) is distinguished from other free-air designs by the introduction of a pre-diluted fumigation gas only at the periphery of an experimental plot and by relatively rapid, closed-loop control of treatment level based on gas concentration, wind speed, and wind direction. This report presents preliminary results concerning facility performance during 1993 and 1994 within three treatment arrays during FACE operations at the Eschikon Experimental Station of the Swiss Federal Institute of Technology, Institute for Plant Sciences, Zurich, Switzerland. The report includes summaries of data describing system reliability, temporal concentration control, spatial concentration control, $C0_2$ use, and ambient $C0_2$ concentrations.

22163 (BNL–61604) **Mitigation options for accidental releases of hazardous gases.** Fthenakis, V.M. Brookhaven National Lab., Upton, NY (United States). [1995]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950927–3: International conference and workshop on modeling and mitigating the consequences of accidental releases of hazardous materials, New Orleans, LA (United States), 26-29 Sep 1995). Order Number DE95011349. Source: OSTI; NTIS; GPO Dep.

The objective of this paper is to review and compare technologies available for mitigation of unconfined releases of toxic and flammable gases. These technologies include: secondary confinement, deinventory, vapor barriers, foam spraying, and water

sprays/monitors. Guidelines for the design and/or operation of effective post-release mitigation systems and case studies involving actual industrial mitigation systems are also presented.

22164 (BNL–61815) **Enhanced shortwave cloud radiative forcing due to anthropogenic aerosols.** Schwartz, S.E. (Brookhaven National Lab., Upton, NY (United States)); Slingo, A. Brookhaven National Lab., Upton, NY (United States); Meteorological Office, Bracknell (United Kingdom). Hadley Centre for Climate Prediction and Research. May 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. UKingdom Department of the Environment PECD 7/12/37. (CONF-950001–1: NATO advanced research workshop on clouds, chemistry and climate, Heidelberg (Germany), 1995). Order Number DE95013319. Source: OSTI; NTIS; GPO Dep.

It has been suggested that anthropogenic aerosols in the troposphere can influence the microphysical properties of clouds and in turn their reflectivity, thereby exerting a radiative influence on climate. This article presents the theoretical basis for of this so-called indirect forcing and reviews pertinent observational evidence and climate model calculations of its magnitude and geographical distribution. We restrict consideration to liquid-water clouds.

22165 (CONF-930133–13) **Simulations of convection using ARM data.** Randall, D.A.; Xu, Kuan-Man. Colorado State Univ., Fort Collins, CO (United States). Dept. of Atmospheric Science. [1993]. 2p. 22166 (CONF-930346–7) **Appendix B: A practical model for the calculation of multiply scattered lidar returns.** Eloranta, E.W. Wisconsin Univ., Madison, WI (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract FG02-90ER61058. Grant N00014-91-J-1558. From Optical Society of America meeting on optical remote sensing of the atmosphere; Salt Lake City, UT (United States); 8-12 Mar 1993. Order Number DE95013015. Source: OSTI; NTIS; GPO Dep.

Lidar results are typically analyzed using an equation which assumes all photons contributing to the return have been singly scattered. Lidar pulses returned from clouds often encounter large optical depths within a short distance of the cloud boundary and many of the received photons are likely to result from multiple scattering. This paper presents an equation to predict the multiply scattered return. The equation is easy to solve on a small computer and allows specification of the scattering cross section and the scattering phase function as a function of penetration depth into the cloud. Atmospheric clouds are made of particles which are large compared to the wavelength of visible and near infrared lidars. Optical absorption by particles is typically negligible at these wavelengths. The solution derived in this paper applies to these conditions. The derivation is an approximation which considers only the contribution due to multiple small angle forward scatterings coupled with one large angle scattering which directs the photon back towards the receiver.

22167 (CONF-940115–33) **Impact of cloud microphysics on cloud-radiation interactions in the CSU general circulation model.** Fowler, L.D.; Randall, D.A. Colorado State Univ., Fort Collins, CO (United States). Dept. of Atmospheric Science. [1995]. 5p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract FG02-91ER61218. Grant ATM-8907414. From 74. American Meteorological Society annual meeting; Nashville, TN (United States); 23-28 Jan 1994. Order Number DE95008979. Source: OSTI; NTIS; GPO Dep.

Our ability to study and quantify the impact of cloud-radiation interactions in studying global scale climate variations strongly relies upon the ability of general circulation models (GCMs) to simulate the coupling between the spatial and temporal variations of the model-generated cloudiness and atmospheric moisture budget components. In particular, the ability of GCMs to reproduce the geographical distribution of the sources and sinks of the planetary radiation balance depends upon their representation of the formation and dissipation of cloudiness in conjunction with cloud microphysics processes, and the fractional amount and optical characteristics of cloudiness in conjunction with the mass of condensate stored in the atmosphere. A cloud microphysics package which encompasses five prognostic variables for the mass of water vapor, cloud water, cloud ice, rain, and snow has been implemented in the Colorado State University General Circulation Model (CSU GCM) to simulate large-scale condensation processes. Convection interacts with the large-scale environment through the detrainment of cloud water and cloud ice at the top of cumulus towers. The cloud infrared emissivity and cloud optical depth of the model-generated cloudiness are interactive and depend upon the mass of cloud water and cloud ice suspended in the atmosphere. The global atmospheric moisture budget and planetary radiation budget of the CSU GCM obtained from a perpetual January simulation are discussed. Geographical distributions of the atmospheric moisture species are presented. Global maps of the top-of-atmosphere outgoing longwave radiation and planetary albedo are compared against Earth Radiation Budget Experiment (ERBE) satellite data.

22168 (CONF-940738–Summ.) **Twenty-third DOE/NRC Nuclear Air Cleaning and Treatment Conference.** Bellamy, R.R. (Harvard Univ., Boston, MA (United States). Harvard Air Cleaning Lab.); Hayes, J.J.; First, M.W. Harvard Univ., Boston, MA (United States). Harvard Air Cleaning Lab.; Nuclear Regulatory Commission, Washington, DC (United States). 24 Mar 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-94EH89439. From 23. DOE/NRC nuclear air cleaning and treatment conference; Buffalo, NY (United States); 25-28 Jul 1994. Order Number DE95009112. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents the details of the Nuclear Air Cleaning and Treatment Conference held in Buffalo, New York during July 1994. Topics discussed include: nuclear air cleaning codes and standards; waste disposal; particulate filter developments; sampling and monitoring of process and effluent streams; off-gasses from fuel reprocessing; adsorbents and adsorption; accident control and analysis; revised source terms for power plant accidents; and the highlight of the conference concerned operations at the West Valley Doe facility where construction is underway to solidify radioactive wastes.

22169 (CONF-9409357–Summ.) **1995 Protocol for Working Group VIII: Influence of environmental changes on climate. US-Russia agreement on cooperation in the field of protection of the environment and natural resources. Final report, January 1, 1994–December 31, 1994.** National Oceanic and Atmospheric Administration, Boulder, CO (United States); US/Russia Agreement on Cooperation in the Field of Protection of the Environment and Natural Resources (United States). Working Group VIII. [1995]. 110p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI02-94ER61759. From 19. annual meeting of Working Group VIII of the Joint US-Russian Committee on Cooperation in the field of protection of the environment and natural resources; St. Petersburg (Russian Federation); 11-17 Sep 1994. Order Number DE95011483. Source: OSTI; NTIS; GPO Dep.

Cooperative research programs of Russia and the United States concerned with global warming and climatic change are briefly described.

22170 (ES/ER/TM–145) **Technical specification for transferring ambient air monitoring data to the Oak Ridge Environmental Information System (OREIS).** Oak Ridge Environmental Information System (OREIS) Program, TN (United States). Jun 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014026. Source: OSTI; NTIS; GPO Dep.

In September 1994, a team was formed to develop, document, and implement technical specifications for transmitting ambient air environmental compliance and monitoring data to the Oak Ridge Environmental Information System (OREIS). The approach used to

transmit this data is documented in the "Plan for Integrating Environmental Compliance and Monitoring Data into OREIS." This plan addresses the consolidated data requirements defined by the Federal Facility Agreement (FFA) and the Tennessee Oversight Agreement (TOA) as they pertain to environmental compliance and monitoring data maintained by Energy Systems' Oak Ridge Environmental Management organizations. Ibis document describes. the requirements, responsibilities, criteria, and format for transmitting ambient air compliance and monitoring data to OREIS.

22171 (ETDE-DE–112) **The implementation of the semi-implicit scheme in cell-integrated semi-Lagrangian models.** Report - Max-Planck-Institut fuer Meteorologie, v. 156. Machenhauer, B.; Olk, M. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). Feb 1995. 37p. Order Number DE95778048. Source: OSTI; NTIS (US Sales Only).

The cell-integrated semi-Lagrangian method, in which trajectories from the corner points of a grid cell define its extent at a previous time, may be applied to a set of equations on Lagrangian form derived from the complete set of primitive equations to construct a numerical model which conserves exactly the discrete forms of the global integrals constraints of mass, momentum, entrophy and total energy. Due to the fulfilment of these integral constraints one should expect the numerical model to be absolutely stable. Experiments with a simple one-dimensional shallow water model show, however, that a time step dependent instability develops when a CFL criterion for gravity waves is exceeded. Analysis of experiments with one-dimensional shallow water models unveil the mechanism of the instability. Using again for simplicity one-dimensional models a main achievement is a successful implementation of the semi-implicit time stepping scheme in the cell-integrated models. (orig.)

This paper contains the analysis of data from the Slovenian measuring grid for the observation of precipitation quality from 1980-1992. Sampling took place monthly with so-called "bulk"-samplers. Precipitation in Slovenia shows a mean content of anions 40-50% HCO_3^-, 35-45% SO_4^{2-}, 10-30%Cl , 5-10% NO_3^- and cations 50% Ca^{2+}, 20% Mg^{2+}, 20% NH_4^+, 10% K^+ Na^+ , stated in terms of mcal/l . Due to the neutralising effect of dust particles in the there were more air alkaline samples with a ph-value above 5.6 except in the vicinity of coal-fired power stations where there is greater carry-over of acids from the atmosphere. Between 1980 and 1992 acid carry-over increased at all measuring stations except Masun where no visible changes were registered. Sulfate concentrations in connurbations and industrial areas increased over this period of time which there were no changes in rural areas. Nitrate concentrations increased at most sites. Sulphur and nitrogen deposition was relatively high and may be a considerable danger to the forest ecosystems especially in the region of Zavodjne with its granite soils. (orig/EW)

22173 (GSF–39/93, pp. 36-48) **Carry-over of ecologically hazardous substances through wet deposition in the Bavarian Northern Alps.** Hahn, J. (CONF-9304291–: International symposium on the carry-over of pollutants from the atmosphere and on forest soil pollution in the ARGE ALP and ALPEN-ADRIA countries, Berchtesgaden (Germany), 27-29 Apr 1993). In *Carry-over of pollutants from the atmosphere and on forest soil pollution in the ARGE ALP and ALPEN-ADRIA countries. Proceedings.* Order Number DE95778131. Source: OSTI; NTIS (US Sales Only).

In the northern alpine regions of Bavaria there is usually strong precipitation due to westerly and northerly winds. Considerable amounts of ecologically hazardous substances are thus carried into the local ecosystems. So far, there is hardly any information or data on quantitites and types of these trace substances or on the influence of meteorological parameters on trace pollutant carry-over. The only measuring programme which systematically recorded wet deposition in the northern Alpine region of Bavaria was carried out by the Fraunhofer-Institute for atmospheric environmental research (IFU). The measuring programme which was based on a grid of six measuring stations along the northern Alpine front in Bavaria from the Hochgrat (Allgaeu) to the Predigtstuhl (Bad Reichenhall) with the focus in the area of Garmisch-Partenkirchen had to cut down by the end of 1989 after considerable financial difficulties had arisen. Thereafter, precipitation could be studied only in the area of Garmisch-Partenkirchen. This study describes the results from the Garmisch-Partenkirchen station. Event-based collected samples of precipitation at this and at all other stations were tested for ph-value, electric conductivity, the most frequent anorganic cations and anions and the trace metals zink, cadmium, lead and copper. Annual and seasonal precipitation quantities and the carry-over rates of the different pollutants were calculated from these data. Time series of a number of ecologically hazardous pollutants were thus obtained, they are discussed in the following. (orig.EW)

The measuring grid "forest climate stations in Bavaria" is a long-time monitoring which creates a broad basis of data relevant to climate and hydrology of forst ecosystem research and also to foresting (prospecting of sites, protection of forests). As the essential forests of Bavaria and the most widespread tree types are monitored it is possible to assess the effects of anthropogenic stresses such as carry-over of air pollutants or expected changes of the climate. Forest climate stations are therefore an important instrument of what is known as preventive environmental protection of forests. Numerous basic measuring series and the extendable infrastructure of measuring stations offer possiblilities of further interdisciplinary cooperation in research and also serve to bundle and intensify research in Bavarian forests. Deposition of pollutants contained in fog to conifers is one important path of carry-over apart from wet deposition. In order to estimate deposition of pollutants from cloud water to conifer forests the liquid water content was registered at the Feldberg/Black Forest over a period of 21 months. A new sight- LWC-relation could be parametrised. With these parameters and the measured values of pollutants contained in fogs we calculated deposition of water quantities at several mountain stations. Fog water samples show higher concentration of pollutants than rainfall. Over a whole year concentrations of sulfate and nitrate when calculated for a uniform liquid water content show a peak in May. Comparative calculations of the flow of cloud water and contents on a forest of conifers were carried out for the period 1982-1991. In higher mountaneous regions deposition of trace substances though fog to needle trees was to be found to be as high as from rainfall. (orig./EW)

Several orographic clouds at heavily polluted (Rhine valley, Filder plains) and less polluted sites (Black Forest, Vosges) were monitored. In order to study carry-over of acids and acid formation in fog one tried to established a full chemical characterisation of the multiphase system fog. Fog water and the particle phase - e.g. particles which have not grown into drops - were collected and chemically analysed before, during and after fog. Concentration of ammonia, nitric acid and hydrogen peroxide in the gas phase was determined and concentrations of O_3 NO_x and SO_2 were used for interpretation. Composition of fog water showed strong, site-dependent differences. Pollution was highest in connurbations. Aas a rule, ammonia, nitrate, sulfate and total carbon content were the most important pollutants contained in fog water and in the particle phase. During fogs too, the particle -bound form of these pollutants was found to be most frequent. Trace material content in fog water can be explained by wash-out of aerosol particles during fog formation and by chemical transformation in the droplets. (orig./EW)

The first step of any air-pollution model consists in recording emissions. While the CORINE-project supplies reliable and detailed data on emissions within the EC since 1985, there has been no similar programme for the remaining countries of Central Europe. This gap has now been filled. Data are available to model developers from the IIASA Status Report "Emission of Air Pollutants in the Region of the Central European Initiative - 1988". For the calculation of long-distance transport the IIASA RAINS-model (Regional Acidification Information System) uses a transport matrix derived from the results of the EMEP-programme. RAINS can also use other transport models. The aim of the RAINS model is to compare emissions with the effect of immissions in order to help with political decision-making. The model includes the following effects: acidification of soils, euthrophication, direct effects on the forests via needles and leaves. (orig./EW)

Distribution and origin of pollutants in the Alpine region were studied with airbourne measurements. At the same time, model simulations of the chemical transformation and transport of noxious gases were carried out. High degrees of pollution were found during high-pressure conditions in the large Alpine valleys (Inn valles, Eisack valley, Etsch valley) where there is a lot of road traffic. Generally the concentration of pollutants was found to be higher south of the Alpine crest than north of it. During radiaton periods the southern Alpine region show a very pronounced circulation between mountains and foreland as well as between valleys and mountains capable of transporting pollutants from the forelands up to the Brenner. It also increases ozone pollution during smog episodes by forming strong inversions with powerful ozone reservoir layers above in the southern Alpine valleys. Comparison of

low-traffic and high-traffic valleys and analysis of hydrocarbon composition gave information on the impact of car traffic on the roads. In the southern Alpine region we found a positiv correlation between regional peak ozone loeads and VOC concentration, in the northern Alpine region this did practically not exist. Simulations of photochemical ozon formation show that on the days when ozone was monitored the peak ozone loads in the southern Alpine could be reduced by reducing VOC-emissions, in the northern areas this would require a reduction on NO_x-emissions. Due to the specific orographic and meteorological conditions local measures can be extremely useful. (orig./EW)

Unfavourable long-term changes of the environment cause forest tree diseases due to different disease-triggering factors in many regions of Europe. Within Hungary the death quota of trees varies widely. In the Hungarian pre-Alpine region only 10% of querus petraea died whereas 30-40% of these trees died in North-Eastern Hungary. The general symptom of querus petraea in canopy thinning. Some of the sick trees dried out whitout showing nutrient deficiencies, others showed N-deficiencies. Soil are mostly parabrown soils acidified due to acid deposition buta link between soil acidification and the death of querus petraea could not be established. Deposition of N is assumed to be increased but no evidence was found in the soil or the oak leaves. We also assume that querus petraea dies less frequently in the pre-Alpine regions because the deposition of N in the pre-alpine region is higher than in NE-Hungary. The most important cause for the dying of querus petraea appears to be the two decades of drought in Hungary. Trees are weakened by water deficits and the drought also reduced microbiological mobilisation of N in the soil, some oaks are deficient in N. The querus petraea forests in the Hungarian pre-Alpine region are healthier because there is more rainfall and the frequent droughts of the last two decades occured mostly in Eastern and Northern Hungary but not in the pre-Alpine region. (orig./EW).

In its second phase the research campaign against "forest death" tries to work out useful knowledge as a basis for forest restoration and conducted several case studies in different damaged forest areas in Austria. By establishing and testing diagnose profiles in the case study areas as well as developing and application of suitable expert systems we hope to find a practice-related solution for the "new" forest damages. For reasons of differential diagnostics we include existing pollution as well as acute causes of damage (eg. forest pasture, game bite etc.). We here introduce the Loisachtal (Tyrol) case study as it is fairly close to the area of the Wank-project. (orig./EW)

Field studies were conducted with fluorescent traceraerosol in order to detect particale washout properties though natural precipitation. Apart from dependence on aerosole particle size we studied predominantly the influence of different raindrop size distributions in precipitations of comparable intensity. Results indicate that in weak precipitations scavenging has an important influence on the overall deposition of airborne particles. (orig./EW)

On the Feldberg and at two more sites precipitation samples were taken and analysed for selected pesticides (Lindan, Isoproturon, Triadimenol, Pirimicarb, Parathion-ethyl and atrazine). Bulk samplers (acc. to Daemmgen) were used in 14-day intervals. At two stations wet-only samplers were used in addition to the bulk samplers. Parathion-ethyl, Pirimicarb and Triadimenol were only found in single cases only. Distinct annual curves could be established for atrazin and isoproturon, they are shown in desposition charts. Only Lindan was detectable all year round. Concentrations were between 3 and 300 ng l^{-1}. Annual curves show good correlation with application periods of the individual substances. In general the annual mean value of the concentrations are below 50 ng l^{-1}. The share of dry deposition depends on substance and weather and account roughly for 10-20% of total deposition. (orig./EW)

Effect-related air quality measurements were carried out in Berchtesgaden-Buchenhoehe in two phases in 1992 and 1993. The photooxidants ozone and peroxiacetylnitrate were measured as well as their precursor substances NO, NO_2, in 1993 also CO and various hydrocarbons and aerosols and their acid components. These measurements are the basis for interpreting parallel lung function studies. Measuring results of June and July 1992 at this site show low mixing ratios of the precurser substances NO and NO2 and low aerosol concentrations. The proportion of acid components in aerosols, however is relatively high compared to Munich but low compared to other measuring stations, for instance in the U.S. Ozon mix is 95 ppb and shows maximum values comparable to the Munich connurbation, daily mean value are 15 to 25% higher. Apart from relatively high ozone mix ratios PAN mix ratios are an indicator of intensive formation of photooxidants. (orig./EW)

22188 (GSF–39/93, pp. 488-492) **Carry-over from clouds through riming of snow crystals. Contribution to ALPTRAC Project P1a.** Kalina, M. Riming of cloud water droplet at snow crystals plays an important role in the interaction between atmosphere and cryosphere; this plays a role in the deposition of pollutants as ion concentrations in precipitation increases with the riming of crystals and it is also important for the balancing of the cloud system and cloud water carry-over. The results of two measuring campaign at the Hoher Sonnblick (3160m, Salzburg Central Alps, Austria) form Nov 11.-18. 1991 and June 16.-19. 1992 are described. The correlation coefficient of linear regression for riming stage-concentration of pollutants for pH is -0.87, for SO_4^{2-} and NO_3^- it is 0.86/0.81; and 0.72 for riming stage /LWC. We must scrap the assumption that the increase of ion concentration in snow sample which is close to concentrations in cloudwater can be explained with strong crystal riming (snow concentration almost totally determined by rimed could water). During autumnal and winterly radiation fog events size fractioned sampling of aerosol rime and fogwater was carried out. Samples were collected on polyethylene plates with a surface of 0.25 m^2. The deposited fog water quantity was as high as 15g/h.m^2. Deposition rate values were between 10^{-4} and 10^{-2} m/s. (orig./EW)

22194 (GSF–39/93, pp. 537-541) **Measuring O_3 and cosmogenic BE-7 in the Central Alps.** Vecchi, R. (Istituto di Fisica Generale Applicata, Univ. Out institut runs a measuring stations of O_3 in the area of Como in the pre-Alpine region and in Valtellina at the Southern rim of the Central Alps. The aim is to study O_3-transport phenomena both vertically and on a horizontal scale. A measuring campaign was conducted which uses BE-7, cosmogenic radionucleid as a trace substance of natural O_3 and as an indicator for probable stratospheric air mass intrusions and foehn phenomena. BE-7 in the stratosphere is generated by spallation of cosmic protones on nitrogen nuclei. (orig./EW)

22195 (IC–95/82) **Analysis of atmospheric concentrations of radon and thoron using beta counting technique.** Islam, G.S. (International Centre for Theoretical Physics, Trieste (Italy)); Basunia, S.M. International Centre for Theoretical Physics, Trieste (Italy). May 1995. 17p. Order Number DE95633238. Source: OSTI; NTIS (US Sales Only); INIS.

This paper presents a detailed theory and experimental procedure for measurement and analysis of mixed radon and thoron in the environment. The technique has been successfully applied to the study of seasonal variations of radon and thoron in Rajshahi atmosphere during the years 1989-1991. The maximum radon concentration in outdoor air was observed in the winter from December to January while the indoor radon concentration was found to be maximum during the monsoon months of July and August. The implication of results is briefly discussed in the paper. (author). 4 refs, 6 figs, 2 tabs.

22196 (JAERI-Research–95-016) **Improvement of a mesoscale atmospheric dynamic model PHYSIC. Utilization of output from synoptic numerical prediction model for initial and boundary condition.** Nagai, Haruyasu (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Yamazawa, Hiromi. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 27p. (In Japanese). Order Number DE95780589. Source: OSTI; NTIS; INIS.

This report describes the improvement of the mesoscale atmospheric dynamic model which is a part of the atmospheric dispersion calculation model PHYSIC. To introduce large-scale meteorological changes into the mesoscale atmospheric dynamic model, it is necessary to make the initial and boundary conditions of the model by using GPV (Grid Point Value) which is the output of the numerical weather prediction model of JMA (Japan Meteorological Agency). Therefore, the program which preprocesses the GPV data to make a input file to PHYSIC was developed and the input process and the methods of spatial and temporal interpolation were improved to correspond to the file. Moreover, the methods of calculating the cloud amount and ground surface moisture from GPV data were developed and added to the model code. As the example of calculation by the improved model, the wind field simulations of a north-west monsoon in winter and a sea breeze in summer in the Tokai area were also presented. (author).

22197 (LA–12932-MS) **Radionuclide concentrations in soils and produce from Cochiti, Jemez, Taos, and San Ildefonso Pueblo Gardens.** Fresquez, P.R.; Armstrong, D.R.; Salazar, J.G. Los Alamos National Lab., NM (United States). May 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95009617. Source: OSTI; NTIS; INIS; GPO Dep.

Radionuclide (^{3}H, ^{90}Sr, ^{137}Cs, ^{238}Pu, ^{239}Pu, and total uranium) concentrations were determined in soils and produce collected from Cochiti, Jemez, Taos, and San Ildefonso Pueblo gardens. All radionuclides in soils from Pueblo areas were within or just above regional statistical (natural and/or worldwide fallout) reference levels. Similarily, the average levels of radionuclides in produce collected from Cochiti, Jemez, Taos, and San Ildefonso Pueblo gardens were not significantly different in produce collected from regional (background) locations. The effective (radiation) dose equivalent from consuming 352 lb of produce from Cochiti, Jemez, Taos, and San Ildefonso, after natural background has been subtracted, was 0.036 (±0.016), 0.072 (±0.051), 0.012 (±0.027), and 0.110 (±0.102) mrem/yr, respectively. The highest calculated dose, based on the mean + 2 std dev (95% confidence level), was 0.314 mrem/yr; this was <0.4% of the International Commission on Radiological Protection permissible dose limit for protecting members of the public.

22198 (LA-UR–95-1077) **Comparison of temperature and humidity profiles with elastic-backscatter lidar data.** Soriano, C. (Universidad Politecnica de Cataluna, Barcelona (Spain)); Buttler, W.T.; Baldasano, J.M. Los Alamos National Lab., NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9509120–1: Air pollution '95, Porto Cerras (Greece), 26-28 Sep 1995). Order Number DE95009496. Source: OSTI; NTIS; GPO Dep.

This contribution analyzes elastic-backscatter lidar data and temperature and humidity profiles from radiosondes acquired in Barcelona in July 1992. Elastic-backscatter lidar data reveal the distribution of aerosols within the volume of atmosphere scanned. By comparing this information with temperature and humidity profiles of the atmosphere at a similar time, we are able to asses de relationship among aerosol distribution and atmospheric stability or

water content, respectively. Comparisons have shown how lidar's revealed layers of aerosols correspond to atmospheric layers with different stability condition and water content.

22199 (LA-UR–95-1353) **An investigation of flow regimes affecting the Mexico City region.** Bossert, J.E. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9507120–3: Mountain meteorology, Breckenridge, CO (United States), 17-21 Jul 1995). Order Number DE95012062. Source: OSTI; NTIS; GPO Dep.

The Mexico City region is well-known to the meteorological community for its overwhelming air pollution problem. Several factors contribute to this predicament, namely, the 20 million people and vast amount of industry within the city. The unique geographical setting of the basin encompassing Mexico City also plays an important role. This basin covers approximately 5000 km^2 of the Mexican Plateau at an average elevation of 2250 m above sea level (asl) and is surrounded on three sides by mountains averaging over 3500 m asl, with peaks over 5000 m asl. Only to the north is their a significant opening in the mountainous terrain. Mexico City sprawls over 1000 km^2 in the southwestern portion of the basin. In recent years, several major research programs have been undertaken to investigate the air quality problem within Mexico City. One of these, the Mexico City Air Quality Research Initiative (MARI), conducted in 1990–1993, was a cooperative study between researchers at Los Alamos National Laboratory and the Mexican Petroleum Institute. As part of this study, a field campaign was initiated in February 1991 during which numerous surface, upper air, aircraft, and LIDAR measurements were taken. Much of the work to date has focused upon defining and simulating the local meteorological conditions that are important for understanding the complex photochemistry occurring within the confines of the city. It seems reasonable to postulate, however, that flow systems originating outside of the Mexico City basin will influence conditions within the city much of the time.

22200 (MISU-IMI-CM–84) **The carbon dioxide measurement program at the Department of Meteorology at Stockholm University.** Holmen, K.; Engardt, M.; Odh, S.Aa. Stockholm Univ. (Sweden). Dept. of Meteorology; International Meteorological Inst., Stockholm (Sweden). Mar 1995. 43p. Order Number DE95779295. Source: OSTI; NTIS.

The carbon dioxide measurement program at the Department of Meteorology, Stockholm University (MISU) is described in detail. The instrumentation and calibration procedures are documented. A description of the monitoring site Ny-Aalesund (78 deg 54'N, 11 deg 53'E) on Spitsbergen is presented. The quality of the monitoring data is discussed and a short presentation of results from the monitoring of CO_2 during 1989 through 1995 is given. Accuracy, precision and reliability have increased substantially during the development of the program. Accuracy is now approaching 0.1 ppm(v) decreasing from values as high as 0.5 ppm(v) during the initial stages of the monitoring effort. During 1994 there are valid data for 94% of the year. Less than 0.1% of the data in 1994 were lost due to local contamination, the remaining loss being due to technical disturbances. The Zeppelinfjellet station monitoring site (474 m above sea level) utilized since March 1990 is excellent for background monitoring of CO_2 with minimal local contamination or other disturbance. For the period January 1989 through February 1995 we observe an annual linear increase of atmospheric CO_2 of 0.67 ppm(v) and a seasonal amplitude of 16.0 ppm(v) at Ny-Aalesund. 29 refs, 9 figs, 6 tabs, 2 appendices with graphs and tables

22201 (NEI-DK–2012) **Development of small cooling systems based on the use of ammonia. Retrofitting of scale-ice machines in relation to conversion from the use of chlorofluorocarbons and hydrochlorofluorocarbons as refrigerants to the use of ammonia.** Arbejdsrapport fra Miljoestyrelsen, 5. Minds, G. (Dansk Teknologisk Institut. Energiteknologi, Taastrup (Denmark)). Miljoestyrelsen, Copenhagen (Denmark). 1995. 77p. (In Danish). Order Number DE95779224. Source: OSTI; NTIS.

A prototype scale-ice machine was developed and tested, using ammonia as a refrigerant. If all freezing machines produced at the Danish firm of 'BUUS Koeleteknik A/S' were converted to the use of ammonia as refrigerant, the reduction of chlorofluorocarbons and hydrofluorocarbons would be about 500 kg p.a. If all this firm's competitors used ammonia as refrigerant the reduction would be 2500 kg p.a., it is claimed. Results of tests showed that substituting ammonia as a refrigerant in small refrigerating plants was feasible. The necessary changes that have to be made in the interests of conversion to the use of ammonia are briefly described in addition to the dimensioning of the components of the machine. A number of photocopies of papers, calculations, letters etc. relevant to the progress of the project are included in the document. (AB)

22202 (NEI-DK–2021) **NO_x reduction by injection of natural gas above the grate, in combination with urea injection in the furnace. Introductory full-scale trial at SAYSAV's waste incineration plant in Malmoe.** Karll, B. (Danish Gas Technology Centre, Hoersholm (Denmark)); Gustafsson, P.Aa. Nordisk Gasteknisk Center, Hoersholm (Denmark). Sep 1994. 23p. Order Number DE95787783. Source: OSTI; NTIS.

Sydvaestra Skaanes Avfallsaktiobolag operates a waste-to-energy plant in Malmoe, Sweden, with two grate-fired incinerator units, incinerating 220,000 tons/year of municipal and industrial waste. In the boilers ca. 500 GWh of thermal energy is recovered, this is supplied to Malmoe's district heating network. The design of the furnace and boiler, and a flow scheme of the plant, are described. The injection of natural gas together with recirculated flue gas is located just above the grate, combined with urea injection in the furnace to reduce NO_x emission. An aim was to find operating conditions characterized by stable combustion with a reasonable level of CO emissions and a significant NO reduction. The overall aim was to establish a range of parameters for which a full-scale demonstration could be planned showing at least 75% NO_x emission reduction in relation to the baseline level of 168 mg/MJ before any measures were taken to reduce the NO_x (NO_x as NO_2 divided by input fuel heat). Efficient NO_x reduction obtained by urea injections was confirmed, but an associated ammonia slip was observed. The effect of injecting natural gas and fuel gas recirculated (FGR) alone is marginal, perhaps owing to furnace design. Combined urea and gas injection produced a strong reduction in ammonia slip compared to urea injection alone. A high urea molar ratio combined with low stoichiometry in the gas injection zone, produced 70% NO reduction. Ammonia slip and CO emissions were somewhat increased. (AB)

22203 (NEI-DK–2026) **Traffic days at AUC. Conference report vol. 1.** ISP's Skriftserie, 132. Lahrmann, H.; Hald Pedersen, L. (eds.). Transportraadet, Copenhagen (Denmark); Aalborg Univ. (Denmark). Trafikforskningsgruppen. 1994. 223p. (In English, Danish, Norwegian). (CONF-9408240–Vol.1: Conference on traffic days at AUC, Aalborg (Denmark), 29-30 Aug 1994). Order Number DE95787784. Source: OSTI; NTIS.

The conference covered problems of sustainable transport, infrastructure, regional development and international worknets, harbors and maritime transport, urban traffic, bicycle traffic, safety and information systems. Regulation of transportation, planning, evaluation, environmental impacts of exhaust gases, cargo transport etc. were discussed in 102 presentations. (EG)

22204 (NEI-DK–2027) **Traffic days at AUC. Conference report vol. 2.** ISP's Skriftserie, 132. Lahrmann, H.; Hald Pedersen, L. (eds.). Transportraadet, Copenhagen (Denmark); Aalborg Univ. (Denmark). In the past few decades, air pollution in many European cities has changed in character. Improved technology, higher stacks and legislation limiting the sulphur contents in fuels have resulted in a marked reduction in the pollution levels of SO_2. On the other hand, due to steady growth of road traffic, the pollution from traffic has increased substantially during the same period. Emissions from traffic have become one of the most important sources of air pollution in larger European cities. Thus, studies of emissions, dispersion and chemical transformations of traffic air pollution in urban areas are becoming of increasing interest. This is felt both at the European and at the national level. At the European level, a COST action on urban air pollution has recently been initiated, aiming at coordinating research activities in the various countries. COST is a European programme for furthering collaboration within science and technology, and the programme is called COST Action 615 on Database, monitoring networks and modelling of urban air pollution. This paper will specifically address a number of Danish activities on air pollution from road traffic; several new monitoring and modelling programmes related to pollution from traffic have recently been initiated at the Danish National Environmental Research Institute (NERI). (au)

22207 (NEI-DK–2027, pp. 417-421) **Utilization of GIS data for environmental estimates.** Sand Bloch, K. (Hoff and Overgaard (Denmark)). Transportraadet, Copenhagen (Denmark); Aalborg Univ. Conference report vol. 2.* 282p. Order Number DE95787805. Source: OSTI; NTIS.

Use of Geographic Information Systems in environmental problems permits to map the location and distribution of city traffic and indicate the potential noise pollution modes and number of apartments affected by noise pollution. (EG)

22208 (NEI-DK–2028) **Traffic days at AUC. Supplementary report.** ISP's Skriftserie, 143. Lahrmann, H.; Hald pedersen, L. (eds.). Transportraadet, Copenhagen (Denmark); Aalborg Univ. (Denmark). Trafikforskningsgruppen. 1994. 218p. (In Danish, English). (CONF-9408240–: Conference on traffic days at AUC, Aalborg (Denmark), 29-30 Aug 1994). Order Number DE95787786. Source: OSTI; NTIS.

A two-volume conference report has been published in connection with the meeting 'Traffic days at the Aalborg University Centre'. The present report is a supplement to these volumes, as some contributions were not delivered before the deadline, and have been first published in full text in the supplementary report. (EG)

22209 (NEI-DK–2028, pp. 155-163) **Cold start analysis and the total national emission.** Bendtsen, H. (Vejdirektoratet, Afd. for Trafiksikkerhed og Miljoe, Forskningssektionen (Denmark)); Thorsen, H. Transportraadet, Copenhagen (Denmark); Aalborg Univ. (Denmark). Trafikforskningsgruppen. 1994. (In Danish). (CONF-9408240–: Conference on traffic days at AUC, Aalborg (Denmark), 29-30 Aug 1994). In *Traffic days at AUC. Supplementary report.* 218p. Order Number DE95787786. Source: OSTI; NTIS.

Emission from a gasoline-driven car with a cold engine is much bigger than from a preheated one, independent of catalysts. Distribution of the total emission during driving with cold and warm engine is 60% and 40% respectively. That is true, even when gasoline cars drive with a cold engine only 9% of their driving time. 34% of the total emission originates from the short trips (27% for cold engine, 7% for warm one) for cars with catalysts. (EG)

22210 (NILU-F–7/94) **Air pollution monitoring for on-line warning and alarm.** Sivertsen, B. Norsk Inst. for Luftforskning, Kjeller (Norway). Apr 1994. 7p. (CONF-9404266–1: International emergency management and engineering conference, Hollywood Beach, FL (United States), 18-21 Apr 1994). Order Number DE95779277. Source: OSTI; NTIS.

The publication deals with a concept on air pollution monitoring. The Norwegian Institute for Air Research (NILU) has been involved in the establishment of air pollution monitoring and modelling for warning and alarm systems during accidental releases and in the surroundings of industrial sites. During the oil fires in Kuwait following the 1990-91 Gulf War, NILU was asked by the World Health Organization (WHO/UNEP) to provide and install monitoring stations for an air quality information and warning system. The installation included a data network with dedicated telephone lines connected to a surveillance centre at the Environmental Protection Department in Kuwait City. Data were transferred to the centre every five minutes. On behalf of the United Nations Centre for Urgent Environmental Assistance (UNCUEA) NILU is establishing a mobile measurement platform and field laboratory for monitoring and modelling of toxic and explosive gases released after a major accident. This technology is further developed to represent part of the environmental information system (EIS) in the MEMbrain project on Major Emergency Management. The publication presents the concept including on-line meteorological measurement for modelling danger zones linked to mobile gas sensors and unmanned airborne vehicle (UAV). 9 refs., 6 figs.

22211 (NILU-F–8/94) **Environmental indicators for long-range atmospheric transported heavy metals.** Berg, T. (Norsk Inst. for Luftforskning, Kjeller (Norway)); Pedersen, U.; Steinnes, E. Norsk Inst. for Luftforskning, Kjeller (Norway). Apr 1994. 6p. (CONF-9405323–1: Workshop on European monitoring, modelling and assessment of heavy metals and persistent organic pollutants, Beekbergen (Netherlands), 3-5 May 1994). Order Number DE95779278. Source: OSTI; NTIS.

The publication deals with environmental indicators developed for long-range transported heavy metals. The indicators are based on data for Pb and Cd from national moss surveys which are performed regularly in Norway. The interpolation programme "kriging" has been used to transform the data from irregular grids to regular grids. Contour maps have been produced, and areas above estimated background levels for Pb and Cd in mosses have been calculated. The indicators are used to characterise the atmospheric deposition of long-range atmospheric transported heavy metals and monitor the changes with time. 7 refs., 3 tabs.

22212 (NILU-OR–11/94) **Environmental indicators for atmospheric supply of long-range transported heavy metals.** Berg, T. (Norsk Inst. for Luftforskning, Kjeller (Norway)); Pedersen, U.; Steinnes, E. Norsk Inst. for Luftforskning, Kjeller (Norway). Jan 1994. 12p. (In Norwegian). Order Number DE95779283. Source: OSTI; NTIS.

The report deals with an identification system designed for identifying the atmospheric supply of long-range transported heavy metals in Norway. The environmental indicators are based on data for lead (Pb) and cadmium (Cd) from the national investigation programme on the concentration of heavy metals in moss being executed every five years. The interpolation programme "kriging" has been used for the transmission of data from an irregular test network to a regular one. From the interpolated data set, a contour map is made together with area computing for determining the pollution level being above the chosen background level. The indicators can be used for showing the extent and changes of atmospheric precipitation of heavy metals in the terrestrial environment. 9 refs., 2 figs., 3 tabs.

22213 (NILU-OR–14/94) **Monitoring of long-range transported air pollution and precipitation. Atmospheric supply 1992.** Toerseth, K.; Joranger, E. Norsk Inst. for Luftforskning,

Kjeller (Norway). Apr 1994. 113p. (In Norwegian). Order Number DE95779274. Source: OSTI; NTIS.

The report deals with a monitoring programme for long-range air pollutants in Norway. The mean concentrations of sulphate, nitrate, ammonium and strong acid in precipitation decreased slightly from 1991 to 1992 in the counties along the southern and western coast in Southern Norway, and in Southeastern Norway the annual mean concentrations are the lowest recorded for the period 1973-1992. The mean concentrations were largely unchanged in other regions including Spitsbergen. In 1992, the annual precipitation amounts were fairly normal in Southeastern Norway, while the rest of Norway received more precipitation than normal. However, the precipitation amounts varied strongly during the year. The wet deposition of sulphate in 1992 in Southern Norway was the lowest ever measured at most stations. At the west coast, in the central and northern part of Norway the amounts deposited were not particularly low in 1992. The annual mean concentrations of sulphate and strong acid in precipitation have been decreasing since 1974. In Southern Norway these constituents were at a maximum in 1979, however. Since 1979 the content of sulphate has decreased by about 30% in Southern Norway, and by 40% in Northern Norway. 36 refs., 22 figs., 69 tabs.

22214 (NILU-OR–17/94, pp. 31-32) **3D model studies of exchange processes in the troposphere over Europe.** Flatoey, F. (Inst. of Geophysics, Univ. of Bergen, Bergen (Norway)); Hov, Oe.; Smit, H. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9403229–: Long-range transported pollutants. Supplies, effects and critical loads, Grimstad (Norway), 7-9 Mar 1994). In *Long-range transported pollutants. Supplies, effects and critical loads.* 210p. Order Number DE95779285. Source: OSTI; NTIS.

A three dimensional Mesoscale Chemistry Transport (MCT) model is driven by data from a Numerical Weather Prediction (NWP) model, over a 10 day period. The meteorological model uses cloud water as one of the prognostic variables and has an advanced treatment of stratiform and convective cloud and precipitation processes. The parameterization gives a higher resolution in time and space of cumulus cloud episodes, and improves the simulation of the convective transport and the computations of the photolysis rates which are highly dependent on cloud cover and cloud optical depth. The 10 day period, in July 1991, is characterized by warm weather and frequent occurrence of cumulus convection. The model results are compared to ground based measurements and ozone profiles. Results presented indicate that physical processes and especially convection dominates in the vertical distribution of ozone of the free troposphere, and that sinking air, compensating convective updrafts, can be an explanation of some episodes where high ozone levels are measured near ground.

22215 (NILU-OR–20/94) **Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.** Nielsen, C.J. (ed.). Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. 234p. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). Order Number DE95787846. Source: OSTI; NTIS.

The report gives a collection of papers from an Nordic symposium on atmospheric chemistry. The papers comprise 31 talks and 19 short poster presentations organized in three sections covering laboratory investigations, field investigations, and theoretical investigations. A number of 21 papers are prepared. 131 refs., 47 figs., 24 tabs.

22216 (NILU-OR–20/94, pp. 9-13) **Determination of ozone isotopomer abundances by microwave- and FTIR-spectroscopy.** Christensen, L. (Lab. of Chemical Physics, Dept. of Chemistry, Univ. of Copenhagen, Copenhagen (Denmark)); Wessel Larsen, N.; Nicolaisen, F.; Pedersen, T.; Soerensen, G.O. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

Deviation from the statistical ratios (2:1) between the isotopomers in mono- and di-^{18}O substituted ozone (henceforth 50-ozone and 52- ozone) has been observed in laboratory experiments aimed at studying the mechanism of ozone formation. Similar deviations seem to occur in the stratosphere. The authors are using two methods to assess the isotopomer ratios r_{50} and r_{52}. Firstly, the microwave-spectroscopy, using a supposedly scrambled mixture of isotopomers. This method is experimentally relatively simple, but there is doubt about the extent to which the calibration mixture is actually scrambled. Secondly, the FTIR-spectroscopy, using the far-infrared, rotational bands of ozone. Although conceptually straightforward this method is fairly involved experimentally. The aim is to measure the far infrared line intensities in one or perhaps two standard mixtures, and then calibrate the microwave spectrometer using the same mixtures. 9 refs., 1 fig., 4 tabs.

22217 (NILU-OR–20/94, pp. 23-26) **Reaction of the nitrate radical with some aliphatic ethers.** Langer, S. (Dept. of Inorganic Chemistry, Univ. of Goeteborg, Goeteborg (Sweden)); Ljungstroem, E. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

There is little doubt about the key role of the nitrate radical in night-time tropospheric chemistry. The increasing use of ethers, especially methyl-butyl ether (MTBE), as automotive fuel additives causes increasing emissions of these compounds to the atmosphere. The paper deals with the rate coefficients for reaction between the nitrate radical and dimethyl ether, diethyl ether, di-n-propyl ether and MTBE. The rate coefficients for the reaction between nitrate radicals and the organic radicals, formed in the primary abstraction step, which is a possible secondary process, were estimated experimentally at a temperature of 295 K using both absolute and relative techniques. 3 refs., 1 tab.

22218 (NILU-OR–20/94, pp. 48-53) **Reactions of NO with a series of peroxy radicals.** Nielsen, O.J. (Chemical Reactivity Section, Environmental Science and Technology Dept., Risoe National Lab., Roskilde (Denmark)); Sehested, J.; Wallington, T.J. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

The rate constants for the reaction of NO with a series of peroxy radicals were measured at 298 K and a total pressure of 1 atm. The rate constants were obtained using the absolute technique of pulse radiolysis combined with time resolved UV-VIS spectroscopy. The results are discussed in terms of reactivity trends and the atmospheric chemistry of peroxy radicals. 20 refs., 1 tab.

22219 (NILU-OR–20/94, pp. 60-64) **Laboratory studies of trace gas uptake on stratospheric aerosol mimics.** Saastad, O.W. (Dept. of Chemistry, Univ. of Oslo, Oslo (Norway)); Lund, C.E.; Ellermann, T.; Nielsen, C.J. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

The paper deals with ozone chemistry. A static reaction chamber attached to a mass spectrometer was employed to study the physi- and chemisorption of trace gases onto cold surfaces with varying concentrations of sulphuric acid, nitric acid and perchloric acid. Results from studies of the uptake of HCl, H Br, NO and NO_2 are presented and discussed in relation to the depletion of stratospheric ozone. 7 refs., 2 figs., 3 tabs.

22220 (NILU-OR–20/94, pp. 76-81) **Adsorption and phototransformation of PAHs on model atmospheric particles.** Tanner, H. (Inst. of Chemical Physics and Biophysics, Estonian Ac. Sci., Tallinn (Estonia)); Bogdanov, A.; Paalme, L. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

The paper deals with the atmospheric chemistry of polycyclic aromatic hydrocarbons (PAHs) with focus on UV-exposed aerosols. The trials focused on aerosol matrices of SiO_2, Al_2O_3 and fly ash and their relative effects on the adsorption and degradation kinetics of three PAHs: Pyrene (Pyr), Chrysene (Chr) and Benzo(a)pyrene (BaP). The degree of PAH adsorption and degradation varied significantly with the particulate matrix used. Shale-oil fly ash proved to adsorb the largest quantity of PAHs and in the least selective manner. In contrast, Al_2O_3 adsorbed the lowest quantity of PAHs and displayed the largest selectivity. The photo-oxidation rate of the PAHs studied was the largest on SiO_2, followed closely by Al_2O_3; half-lives in the range of 4 to 6 min. The half-lives for oil-shale fly ash measured in days. Variation in transformation rates between the various PAHs on any given matrix was found to be less significant than the variation seen on different matrices. Pyr was constantly the most reactive compound, followed by BaP and finally Chr, regardless of the matrix used. 1 ref., 5 figs.

22221 (NILU-OR–20/94, pp. 91-94) **NO_x, PAN, Alkyl, Nitrates, NO_y and O_3 measurements during spring in interior Alaska.** Beine, H.J. (Geophysical Inst., Univ. of Alaska, Fairbanks, AK (United States)); Jaffe, D.A.; Atlas, E. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

Measurements of the atmospheric concentrations of NO, NO_2, NO_y, O_3, peroxy-acetylnitrate (PAN), alkyl nitrates and hydrocarbons were made in a boreal forest ecosystem in the interior Alaska in April and May 1993. Median mixing ratios for background periods of NO_x, NOy and O_3 were 150 [ppt], 506 [ppt] and 25 [ppb], respectively. The PAN contribution to NOy was about 30%. PAN is correlated with ozone, but not with NO_x, suggesting that both, PAN and ozone were produced at a distant sources and were transported to the site. 4 refs., 6 figs., 1 tab.

22222 (NILU-OR–20/94, pp. 95-99) **Atmospheric deposition monitoring in Lithuania.** Budvytyte, D. (Inst. of Physics, Vilnius (Lithuania)); Sopauskiene, D. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

During the last decades the assessment of the atmospheric pollution load on ecosystems have been carried out in most European countries [1-5]. Atmospheric precipitation have been considered to contribute a considerable part of pollutants from the atmosphere to ecosystems. The continuous atmospheric precipitation chemistry monitoring was established in Lithuania in 1981. The main objectives of the monitoring programme were to determine the regional background air pollution and to assess pollutants load from the atmosphere to the ecosystems. Bulk collectors for precipitation were arranged at three rural sites relatively far from local anthropogenic pollution sources. These sites represent different parts of Lithuania, Preila - coastal site i W of Lithuania, Zuvintas - inland site i SW of Lithuania, and Moletai - inland forest area in E of Lithuania, and therefore, they can be treated as being representative for Lithuanian regional conditions. Monthly precipitation samples were collected and analyzed for all major ions using classical analytical chemistry methods. 8 refs., 1 fig., 3 tabs.

22223 (NILU-OR–20/94, pp. 100-103) **Heavy metals in the interaction atmosphere - earth's surface.** Ceburnis, D. (Inst. of Physics, Vilnius (Lithuania)). Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

The paper deals with concentrations of metals in ecosystems as a function of atmospheric deposition in Lithuania. A quantitative comparison of precipitation data, moss analyses data and direct air measurements (carried out in Lithuania during 1990-1993) was made to evaluate the influence of the non atmospheric origin sources (dust from the soil surface, higher vegetation, etc.) to the content of trace metals in the moss. It was estimated that about 40% Cr content in the moss and more than 60% of Fe comes from sources other than atmospheric deposition. An average metal retention efficiency factor up to 60% in the moss was evaluated, but the variation of this factor between different elements is very significant. Deposition velocity rates for different elements range from 0.30 to 1.48 cm/s. 7 refs., 1 fig., 2 tabs.

22224 (NILU-OR–20/94, pp. 104-109) **Application of tracers in atmospheric dispersion experiments.** Ellermann, T. (National Environmental Research Inst., Dept. of Emission and Air Pollution, Roskilde (Denmark)); Lund Thomsen, E.; Lyck, E. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

The paper deals with the use of inert tracers, SF_6 and perfluorocarbons in studies of the transport and dispersion of air pollutants. The tracer is released to the atmosphere and the ground level concentrations are measured at a network of sampling units placed downwind from the release point. The aim is to examine the relationship between emission and the resulting concentration distribution for various meteorological conditions and to provide data for assessing the quality of theoretical dispersion models, SF_6 and perfluorocarbons are used as tracers due to their physical and chemical properties, - inert, nontoxic, low detection limit etc. SF_6 can be used in experiments on a range from 1 to 150 km. The perfluorocarbons (perfluoromethylcyclopentane, perfluoromethylcyclohexane, perfluorodimethylcyclohexane) can be used in experiments ranging up to thousands of km. This presentation outlines the SF_6 and perfluorocarbon tracer techniques as used at the National Environmental Research Institute. 6 refs., 3 figs.

22225 (NILU-OR–20/94, pp. 122-127) **Tropospheric nitrogen oxides in the arctic.** Jaffe, D. (Geophysical Inst. and Dept. of Chemistry, Univ. of Alaska, Fairbanks, AK (United States)). Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

Nitrogen oxides play an important role in tropospheric photochemistry. NO_x is important due to its critical role in ozone production. The major end product of NO_x oxidation is HNO_3 which is a primary component of "acid precipitation". Other nitrogen oxides, such as peroxyacetyl nitrate (PAN), may provide a temporary reservoir of NO_x and therefore be important in transporting NO_x to remote regions. Since the atmospheric lifetime of NO_x is of order one day or less, most of the global atmosphere contains very low concentrations of NO_x. There is good evidence that increasing anthropogenic NO_x and hydrocarbon emissions have affected O_3 and nitric acid concentrations in remote regions of the Northern Hemisphere. Ozone data in both rural and remote regions indicate substantial increases over the last several decades (Crutzen 1988 and references therein). In the Arctic, the continuous record of surface O_3 from Barrow, Alaska shows a steady increase in concentrations of about 1.5% per year during summer. During other seasons, no statistically significant trend is present. Nitrate in the Greenland ice core also shows a substantial anthropogenic effect with concentrations approximately doubling since 1955. In the Arctic, anthropogenic pollutants are known to be present in relatively high concentration during the winter-spring period. However, as stated above, the tropospheric ozone increase is only evident during summer when other pollutants generally show a minimum. Understanding this long term increase in tropospheric ozone in the Arctic is one of the primary objectives presented. 6 refs., 3 figs.

22226 (NILU-OR–20/94, pp. 128-132) **Heavy metals in the atmosphere in Finland.** Jalkanen, L. (Finnish Meteorological Inst., Air Quality Dept., Helsinki (Finland)); Virkkula, A.; Hillamo, R.; Haesaenen, E. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third*

Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93. 234p. Order Number DE95787846. Source: OSTI; NTIS.

The paper deals with the results from the analysis of heavy metals precipitated at seven background stations located in different parts of Finland. Atmospheric aerosol samples, divided into two fractions, were collected. The stations are susceptible to transport of air pollutants from different sources in Russia and Central Europe. Major emission sources of heavy metals in Finland, deposition from precipitation, and concentrations in atmospheric aerosols are discussed. 8 refs., 2 figs., 4 tabs.

22227 (NILU-OR–20/94, pp. 133-136) **Long range transport of atmospheric heavy metals.** Kvietkus, K. (Inst. of Physics, Vilnius (Lithuania)); Sakalys, J. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

The paper presents the regional background levels of the atmospheric heavy metals during the long term observation. The input of the heavy metals to the Baltic sea region and Lithuania from the main prevailing wind directions is analysed and estimated. 7 refs., 2 figs.

22228 (NILU-OR–20/94, pp. 137-140) **Atmospheric mercury. Sources, speciation and deposition.** Munthe, J. (Swedish Environmental Research Inst., Goeteborg (Sweden)). Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

The atmosphere is important in the environmental cycling of mercury since it serves as a medium for transport from sources to remote areas. Chemical and physical transformations occur in the atmosphere leading to deposition of mercury. The rate of deposition of mercury from the atmosphere is highly dependent on the speciation. In Sweden, annual mean concentrations of total mercury and methylmercury in precipitation as well as wet deposition fluxes are higher in the south than in the north indicating an influence of the industrialized and densely populated areas of northern and central Europe. 20 refs.

22229 (NILU-OR–20/94, pp. 161-163) **Ozone loss in the Northern Hemisphere, spring 1993: Trajectory model simulations.** Floeisand, I. (Norwegian Inst. for Air Research, Kjeller (Norway)); Stordal, F. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

The paper deals with a trajectory model with coupled modules representing gas phase photochemistry, microphysics and heterogeneous chemical reactions has been used for simulations of the chemistry of the stratosphere. The model has been developed through a collaboration between NILU, the University of Oslo and the Danish Meteorological Institute. The two-dimensional trajectories for the isentropic level corresponding to a potential temperature of 475 K and potential vorticity fields have been obtained from the European Centre for Medium-Range Weather Forecasts. 4 refs., 2 figs., 1 tab.

22230 (NILU-OR–20/94, pp. 164-169) **HILATAR and FINOX, 3-dimensional grid models for regional air pollutant dispersion studies.** Hongisto, M. (Finnish Meteorological Inst., Air Quality Dept., Helsinki (Finland)). Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

The variation of air pollutant concentrations, their exposure times and deposition are simulated at the Finnish Meteorological Institute using Eulerian type air quality models. The models are built mainly for acid deposition studies, covering nitrogen and sulphur compounds. Results of calculations made by a grid model for oxidized nitrogen compounds over Finland as well as experience with shorter time sulphur pollution with HILTAR model are discussed. 5 refs., 4 figs., 1 tab.

22231 (NILU-OR–20/94, pp. 188-191) **Impact of NO_x-emissions from aircraft on ozone chemistry.** Kraaboel, A.G. (Norwegian Inst. for Air Research, Kjeller (Norway)); Stordal, F. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

The NO_x-emissions from aircraft cause a larger change in ozone compared to man-made NO_x-emissions at the surface. An ozone change near the tropopause also has a stronger impact on the radiative forcing, and thereby the climate. A trajectory model is used to study the effects of aircraft NO_x-emissions on the ozone chemistry at cruise altitude. The distribution of NO_x in the troposphere, and particularly the distribution and seasonal variations in the upper troposphere, are not well known. Due to a short atmospheric lifetime coupled with inadequate monitoring networks, the determination of long-term trends and spatial and temporal distribution is difficult. The authors were therefore particularly interested in how the impact of NO_x-emissions changed with different initial values of nitrogen in the airparcel. 4 refs., 4 figs., 2 tabs.

22232 (NILU-OR–20/94, pp. 192-196) **Chemistry and physics of aerosol dynamics in the atmosphere.** Kulmala, M. (Dept. of Physics, Univ. of Helsinki, Helsinki (Finland)). Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

Aerosol dynamics, particularly formation and growth of aerosol particles and cloud droplets are strongly dependent on atmospheric chemistry. The chemical reactions in the gas phase and in the liquid phase as well as surface reactions influence on mass fluxes. On the other hand the size, concentration and composition of aerosol particles determines the surface and volume available for surface and liquid phase chemical reactions. Wide spectrum of chemistry and physics is needed to understand air pollution. In this presentation, the author outlines the connection between atmospheric chemistry and aerosol science. 17 refs., 2 figs.

22233 (NILU-OR–20/94, pp. 206-209) **Atmospheric mercury modelling at IVL.** Pleijel, K. (Swedish Environmental Research Inst., Goeteborg (Sweden)); Munthe, J. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

A model has been developed, describing the mass transport and chemical turnover of different forms of mercury in the atmosphere. An air parcel including a fog, is simulated during 48 hours, and the influence on dissolved oxidised mercury of varying physical and chemical parameters has been studied. Calculation are carried out, using different aqueous phase chemistry schemes for different pH levels. The results show a reduction in the dissolved Hg(II) by 11 to 65% of the SO_2 concentration and emissions are doubled and an increase in dissolved Hg(II) by 20 to 130% when increasing the O_3 concentration by 40% and doubling the NO_x and VOC emissions. The total Hg(II) concentration increase by 0 to 57% when doubling the soot concentration. 10 refs., 1 fig.

22234 (NILU-OR–20/94, pp. 210-215) **Stratospheric chemistry in a 3-D global CTM.** Rummukainen, M. (FMI/Sodankylae Observatory, Sodankylae (Finland)); Isaksen, I.S.A.; Stordal, F. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

In Norway, there has been started a work on running a consistent stratospheric chemistry formulation in a global three-dimensional Chemical Transport Model (CTM). So far, the model has been used for studying tropospheric chemistry, especially at high northern latitudes. The stratospheric chemistry scheme has now been successfully incorporated into the CTM. This presentation will focus on the coupled troposphere-stratosphere formulation of the CTM, and an update on this project will be given, together with some preliminary results. 9 refs., 2 figs., 1 tab.

22235 (NILU-OR–20/94, pp. 222-227) **A two-dimensional global study of the tropospheric ozone production.** Strand, A. (Geofysisk Inst., Univ. i Bergen, Bergen (Norway)); Hov, Oe. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9312108–: NORSAC '93: 3. Nordic symposium on atmospheric chemistry, Geilo (Norway), 3-5 Dec 1993). In *Third Nordic symposium on atmospheric chemistry. Proceedings of NORSAC '93.* 234p. Order Number DE95787846. Source: OSTI; NTIS.

The ozone production in the troposphere has been studied by means of a zonally averaged model which consists of a two-dimensional transport model, a description of the emissions, wet and dry deposition and chemical processes of importance for the ozone production in the troposphere. The transport model describes a closed circulation in the meridional plane below 10 hPa, and has a resolution and a numerical solution which compares favourable with earlier 2-D studies. The transport model also takes into account the fast vertical mixing in convective clouds and in frontal circulation. The production of nitrogen oxides by lightning has been coupled to the convection parameterization by assuming that the nitrogen oxides are transported vertically in the thunder clouds and released at the altitudes where boundary layer air entrained in the convective cells is released. Comparison with observations indicate that the model is able to reproduce the seasonal variation of ozone in the meridional plane quite realistically. The calculated distributions of the chemical species which determine tropospheric ozone also compare well with measurements. A few simple experiments demonstrate the potential of the model as a tool to investigate the effect of emission reduction strategies. A 2-D model can never simulate the real atmosphere as realistic as 3-D models, but the complexity of the chemical reaction scheme combined with the possibility of cheap integrations over periods of several years, make the results from such models interesting for environmental policies. 8 refs.,

22236 (NILU-OR–23/94) **Peroxy acetyl nitrate intercalibration. Final report. Step EV4V-CT90-0222.** Krognes, T. (and others); Toupance, G.; Glavas, S. Norsk Inst. for Luftforskning, Kjeller (Norway). Jun 1994. 53p. Order Number DE95779275. Source: OSTI; NTIS.

The report deals with intercalibration of PAN (peroxy acetyl nitrate). PAN is a highly reactive and thermally unstable photo oxidant. It is formed in the atmosphere when a mixture of nitrogen oxides and organic compounds is irradiated by sunlight. It is an important reservoir for nitrogen oxides in the atmosphere. PAN interferes with many types of NO_x monitors. In large cities and industrial areas PAN is an important component of photochemical "smog". It may cause irritation of respiratory organs, and in some cases cause plant damage. One country (Italy) presently has passed legislation that includes PAN among the air quality parameters that shall be monitored in polluted areas. Good monitoring and calibration methods are required to fulfill the purpose of such legislation. The emission of nitrogen oxides (NO_x) is subjected to international treaties. To control the effect of such treaties, monitoring and modelling of NO_x components is required. PAN is not the major component, but a significant part of this picture in central European areas. In arctic areas, PAN is a major component of NO_y, and a large contributor to NO_x. 6 figs., 2 tabs.

22237 (NREL/TP–463-5784) **National Solar Radiation Data Base (1961-1990). Final technical report. Volume 2.** National Renewable Energy Lab., Golden, CO (United States). Jan 1995. 313p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95000262. Source: OSTI; NTIS; GPO Dep.

The 1961-1990 National Solar Radiation Data Base (NSRDB) for the United States was completed in September 1992. This was the final product of four years of work under the U.S. Department of Energy (DOE) Solar Radiation Resource Assessment Project. The NSRDB contains 30 years of hourly data for five solar radiation elements and 15 meteorological elements for 239 sites. The user's manual (NSRDB-Volume 1, 1992) for the NSRDB provides detailed information on the structure of the data base and the products that have been produced from it. Most users of the data base will find all of the information that they need in Volume 1. Volume 2 has been written primarily for researchers who need more information about the methods employed in producing the data base. In addition to research results, we have included information on practical lessons learned from this project. Therefore, Volume 2 should be of value to anyone developing a similar data base for other regions or other countries. Most of the solar radiation data in the NSRDB and the previous SOLMET (SOLar METeorological) data base were generated by computer models. Therefore, a major part of this report is centered around the METeorological/STATistical (METSTAT) model (Section 3.0), its input data (Sections 5.0 and 6.0), its use in producing the NSRDB (Sections 4.0 and 7.0), and comparisons with the models used in producing the SOLMET data base (Section 10.0).

22238 (ORNL/CDIAC–76) **Carbon dioxide information Analysis Center and World Data Center: A for Atmospheric trace gases. Annual progress report, FY 1994.** Burtis, M.D. (comp.) (Tennessee Univ., Knoxville, TN (United States). Energy, Environment and Resources Center); Cushman, R.M.; Boden, T.A.; Jones, S.B.; Nelson, T.R.; Stoss, F.W. Oak Ridge National Lab., TN (United States). Mar 1995. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95011769. Source: OSTI; NTIS; GPO Dep.

Environmental Sciences Division Publication No. 4352.

This report summarizes the activities and accomplishments made by the Carbon Dioxide Information Analysis Center and World Data Center-A for Atmospheric Trace Gases during the fiscal year 1994. Topics discussed in this report include; organization and staff, user services, systems, communications, Collaborative efforts with China, networking, ocean data and activities of the World Data Center-A.

22239 (ORNL/CDIAC–80) **Carbon-13 isotopic abundance and concentration of atmospheric methane for background air in the Southern and Northern Hemispheres from 1978 to 1989.** Stevens, C.M. (Argonne National Lab., IL (United States)); Sepanski; Morris, L.J. Oak Ridge National Lab., TN (United States). Carbon Dioxide Information Analysis Center. Mar 1995. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (NDP–049). Order Number DE95012083. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication No. 4388.

Atmospheric methane (CH_4) may become an increasingly important contributor to global warming in future years. Its atmospheric concentration has risen, doubling over the past several hundred years, and additional methane is thought to have a much greater effect on climate, on a per molecule basis, than additional $C0_2$ at present day concentrations (Shine et al. 1990). The causes of the increase of atmospheric CH_4 have been difficult to ascertain because of a lack of quantitative knowledge of the fluxes (i.e., net emissions) from the numerous anthropogenic and natural sources. The goal of CH_4 isotopic studies is to provide a constraint (and so reduce the uncertainties) in estimating the relative fluxes from the various isotopically distinct sources, whose combined fluxes must result in the measured atmospheric isotopic composition, after the fractionating effect of the atmospheric removal process is considered. In addition, knowledge of the spatial and temporal changes in the isotopic composition of atmospheric CH_4, along with estimates of the fluxes from some of the major sources, makes it possible to calculate growth rates for sources whose temporal emissions trends would be difficult to measure directly.

22240 (PNL-SA–26034) **Balloon-borne radiometer profiler: Field observations.** Shaw, W.J.; Whiteman, C.D.; Anderson, G.A.; Alzheimer, J.M.; Hubbe, J.M.; Scott, K.A. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9503140–3: 5. atmospheric radiation

measurement (ARM) meeting, San Diego, CA (United States), 20-23 Mar 1995). Order Number DE95011493. Source: OSTI; NTIS; INIS; GPO Dep.

This project involves the development of the capability of making routine soundings of broadband radiative fluxes and radiative flux divergences to heights of 1500m AGL. Described in this document are radiometers carried on a stabilized platform in a harness inserted in the tetherline of a tethered balloon meteriological sounding system. Field test results are given.

22241 (RISO-R–816(EN)) **TRACT database no. 4: Surface measurements. Station and data description.** Barthelmie, R.J.; Jensen, N.O. Gendan A/S, Copenhagen (Denmark). Apr 1995. 56p. Order Number DE95787744. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

The TRACT-subproject constitutes one of the main field programmes of EUROTRAC (the Eureka environmental project) 'European experiment on transport and transformation of environmentally relevant trace constituents in the troposphere over Europe'. Observations collected during the TRACT experimental campaign (conducted in September 1992) have been divided into nine databases. Database no.4 (DB no.4), which is described here, contains the surface measurements including deposition. Most of the data is meteorological although the database also contains ozone and nitrogen dioxide measurements. Considerable effort has been spent in standardising the data including supplying standard variable names and missing data codes. DB no.4 has been constructed within Paradox although it can be translated into any relational database. Following the database description is a detailed report of the data available from each of the stations which includes a station description, if one was supplied. Also given is a preliminary comparison of the data. (au) 22 tabs., 4 ills., 4 refs.

22242 (SAND–94-2586) **Preliminary evaluation of techniques for transforming regional climate model output to the potential repository site in support of Yucca Mountain future climate synthesis.** Church, H.W.; Zak, B.D.; Behl, Y.K. Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95013874. Source: OSTI; NTIS; INIS; GPO Dep.

The report describes a preliminary evaluation of models for transforming regional climate model output from a regional to a local scale for the Yucca Mountain area. Evaluation and analysis of both empirical and numerical modeling are discussed which is aimed at providing site-specific, climate-based information for use by interfacing activities. Two semiempirical approaches are recommended for further analysis.

22243 (SAND–95-8519C) **Raman lidar profiling of atmospheric water vapor.** Goldsmith, J.E.M.; Bisson, S.E. Sandia National Labs., Livermore, CA (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9504157–1: Combined optical-microwave earth and atmosphere conference, Atlanta, GA (United States), 3-6 Apr 1995). Order Number DE95010697. Source: OSTI; NTIS; GPO Dep.

22244 (SAND–95-8556C) **Implementation of Raman lidar for profiling of atmospheric water vapor and aerosols at the SGP CART site.** Goldsmith, J.E.M.; Blair, F.H.; Bisson, S.E. Sandia National Labs., Livermore, CA (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503140–6: 5. atmospheric radiation measurement (ARM) meeting, San Diego, CA (United States), 20-23 Mar 1995). Order Number DE95011408. Source: OSTI; NTIS; GPO Dep.

Short communication. AEROSOLS/spatial distribution; WATER VAPOR/spatial distribution; GREENHOUSE GASES/monitoring; AEROSOLS; MONITORING; TROPOSPHERE; ATMOSPHERIC CIRCULATION; RAMAN EFFECT; OPTICAL RADAR

22245 (UCRL-ID–119127) **Implementation of a Rayleigh scattering optical depth parameterization.** Kemball-Cook, S.R.; Grant, K.E. Lawrence Livermore National Lab., CA (United States). Oct 1994. 4p. Sponsored by USDOE, Washington, DC (United States);Environmental Protection Agency, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013261. Source: OSTI; NTIS; GPO Dep.

A new procedure for calculating Rayleigh scattering cross sections and optical depths has been developed for use in the solar radiation transfer model of the LLNL Chemistry-Radiation-Transport Models. This procedure replaces the previous method for determining the optical depths in which the parameterization of Hansen and Travis (1974) was used to generate a table of optical depths for wavelengths ranging from 0.135 μm to 0.729 μm; the table was then placed directly in the shortwave package. Hansen and Travis calculate Rayleigh scattering optical depths, τ, using $\tau = 0.08569\lambda^{-4}(1 + 0.0113\lambda^{-2} + 0.00013\lambda^{-4})$ where λ is wavelength in μm and the standard surface pressure is 1013 mB. The new scheme uses instead the parameterization of Nicolet (1984) to find the Rayleigh scattering cross sections for an arbitrary set of wavelength bins, and from these cross sections, determines the optical depths. The Nicolet parameterization was recommended by the WMO (1986), and calculates Rayleigh scattering cross sections using $O_{RS} = 4.02 \times 10^{-28}/\lambda^{-(4 + x)}$ where $x=0.389\lambda + 0.09426/\lambda - 0.3328$ for $\lambda < 0.55$ μm and $x=0.04$ for $\lambda > 0.55$ μm.

22246 (UCRL-ID–119709) **Radiometer measurements and modeling of ultraviolet radiation at LLNL.** Wuebbles, D.J. (Lawrence Livermore National Lab., CA (United States)); Patten, K.O. Jr.; Grossman, A.S. Lawrence Livermore National Lab., CA (United States). Jan 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011442. Source: OSTI; NTIS; GPO Dep.

A program at the LLNL for the measurement and monitoring of ultraviolet radiation is briefly described, with an emphasis on seasonal variations, and aerosol effects.

22247 (UCRL-JC–117424) **LLNL and TRW extend benchmark environmental stress testing for two alternative printed board cleaners.** Hersey, R.J. Jr. (Lawrence Livermore National Lab., CA (United States)); Meltzer, M.; Hofstad, H.W.; Lawrence, M.; Sanborn, R.; Arauco, H. Lawrence Livermore National Lab., CA (United States). Mar 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9506182–1: NEPCON East '95, Boston, MA (United States), 12-15 Jun 1995). Order Number DE95011718. Source: OSTI; NTIS; GPO Dep.

TRW Corporation and LLNL jointly conducted a testing program to evaluate the effectiveness of non-CFC defluxing chemistries on printed boards designed for high reliability military and aerospace applications. TRW assessed existing data for alternative chemistries, selected candidates for further testing, implemented the cleaning processes, and performed ionic conductivity testing on the spent solvents. LLNL designed and fabricated special circuit boards with interdigitated comb patterns to allow insulation resistance (IR) measurements under selected soldered components. LLNL designed the test and measurement setup and conducted accelerated environmental stress testing of flux residues for 28 days following cleaning. Statistical analyses of the IR measurements were correlated with visual observations and spectroscopic (FTIR) measurements. Performance of the alternative chemistries was compared with that of a standard CFC cleaning agent also included in the test program. The program was designed to follow the same environmental stress and electrical measurement requirements as the IPC/DOD/EPA Ad Hoc Solvent Working Group's benchmark 7-day test plan, but with certain minor modifications and extension to 28 days.

22248 (UCRL-JC–117494) **Atmospheric model intercomparison project: Monsoon simulations.** Sperber, K.R. (Lawrence Livermore National Lab., CA (United States). Program for Climate Model Diagnosis and Intercomparison); Palmer, T.N. Lawrence Livermore National Lab., CA (United States). Jun 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9405322–1: International conference on

monsoon variability and prediction, Trieste (Italy), 9-13 May 1994). Order Number DE95012223. Source: OSTI; NTIS; GPO Dep.

The simulation of monsoons, in particular the Indian summer monsoon, has proven to be a critical test of a general circulation model's ability to simulate tropical climate and variability. The Monsoon Numerical Experimentation Group has begun to address questions regarding the predictability of monsoon extremes, in particular conditions associated with El Nino and La Nina conditions that tend to be associated with drought and flood conditions over the Indian subcontinent, through a series of seasonal integrations using analyzed initial conditions from successive days in 1987 and 1988. In this paper the authors present an analysis of simulations associated with the Atmospheric Model Intercomparison Project (AMIP), a coordinated effort to simulate the 1979–1988 decade using standardized boundary conditions with approximately 30 atmospheric general circulation models. The 13 models analyzed to date are listed. Using monthly mean data from these simulations they have calculated indices of precipitation and wind shear in an effort to access the performance of the models over the course of the AMIP decade.

22249 (UCRL-JC–118287) **Target induced, turbulence-modulated speckle noise.** Scharlemann, E.T. Lawrence Livermore National Lab., CA (United States). Jul 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9404162–22: 1994 chemical analysis by laser interrogation of proliferation effluents (CALIOPE ITR) interim technical review, Livermore, CA (United States), 26-28 Apr 1994). Order Number DE95014202. Source: OSTI; NTIS; GPO Dep.

Many papers on DIAL for remote sensing have been devoted to the averaging properties of speckle noise from diffuse-target returns; i.e., how many (N) return pulses can be averaged before the I/N reduction in signal variance expected from uncorrelated noise fails. An apparent limit of about 100 pulses or fewer has been the most important factor in determining the accuracy of DIAL measurements using diffusely-scattering targets in the field. The relevant literature is briefly reviewed, and various explanations for the apparent limit are summarized. Recent speckle experiments at LLNL's Site 300 may suggest that the limit of ~100 pulses is not fundamental. The speckle experiments very clearly show that the limit on signal averaging in this data was the result of long-term (~1 minute) drifts in the signal returns rather than of any more subtle statistical properties. The long-term drifts are completely removed to the useful limits of the data sets by working with the log-ratio of adjacent pulses. This procedure is analogous (but not identical) to processing the log-ratios of the powers at different wavelengths in a multi-line DIAL system. We think the Site 300 data therefore suggests that as long as the laser system is constructed to ensure that any long-term drifts are identical among the transmitted wavelengths, the log-ratio of the individual returns will provide a data set that does usefully average over a large number of pulses.

22250 (UCRL-JC–118707) **Multi-angle technique for measurement of ground source emission.** Henderson, J.R. Lawrence Livermore National Lab., CA (United States). Apr 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950472–7: SPIE international symposium on aerospace/defense sensing and dual-use photonics, Orlando, FL (United States), 17-21 Apr 1995). Order Number DE95011722. Source: OSTI; NTIS; GPO Dep.

TAISIR, the Temperature and Imaging System Infrared, is a nominally satellite based platform for remote sensing of the earth. One of its design features is to acquire atmospheric data simultaneous with ground data, resulting in minimal dependence on external atmospheric models for data correction. One technique we employ to acquire atmospheric data is a true multi-angle data acquisition technique. Previous techniques have used only two angles. Here we demonstrate the advantage of using a large number of viewing angles to overconstrain the inversion problem for critical atmospheric and source parameters. For reasonable data acquisition scenarios, simulations show source temperature errors of less than 1K should be possible. Tradeoffs between flight geometry, number of look angles,, and system signal-to-noise are given for typical parameter ranges.

22251 (UCRL-JC–119134) **ARAC participation in the European tracer experiment.** Pace, J.C. (EG and G Energy Measurements, Inc., Pleasanton, CA (United States)); Pobanz, B.M.; Foster, C.S. Lawrence Livermore National Lab., CA (United States); EG and G Energy Measurements, Inc., Pleasanton, CA (United States). Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ; AC08-93NV11265. (CONF-950430–5: 5. ANS topical meeting on emergency preparedness and response, Savannah, GA (United States), 18-21 Apr 1995). Order Number DE95012483. Source: OSTI; NTIS; GPO Dep.

This paper describes participation by the Lawrence Livermore National Laboratory's Atmospheric Release Advisory Capability (ARAC) in the 1994 European Tracer Experiment (ETEX). ARAC is a real-time emergency-response center, operating a suite of numerical models which simulate the advection and diffusion of airborne releases, and which calculate estimates of the downwind concentration of the released material. The ETEX scenario involved actual releases of inert tracer gases into the atmosphere, with detection by samplers at many locations across Europe, allowing subsequent comparison between detected values and the values predicted at each sampler location by the exercise participants. To prepare for ETEX, ARAC made only minor changes to its operational models, primarily related to the large area covered by the plume. The ARAC response to ETEX was similar to that for a release at any non-supported location. Results based on various externally-supplied wind fields will be discussed.

22252 (USGS-OFR–94-569) **Volcanic gas emissions and their impact on ambient air character at Kilauea Volcano, Hawaii.** Sutton, A.J. (Minerals Management Service, Menlo Park, CA (United States)); Elias, T.; Navarrete, R. Minerals Management Service, Menlo Park, CA (United States); Geological Survey, Hawaii National Park, HI (United States). Hawaiian Volcano Observatory. [1994]. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-93OR22089. Order Number DE95013087. Source: OSTI; NTIS; GPO Dep.

Gas emissions from Kilauea occur from the summit caldera, along the middle East Rift Zone (ERZ), and where lava enters the ocean. We estimate that the current ERZ eruption of Kilauea releases between 400 metric tonnes of SO_2 per day, during eruptive pauses, to as much as 1850 metric tonnes per day during actively erupting periods, along with lesser amounts of other chemically and radiatively active species including H_2S, HCl and HF. In order to characterize gas emissions from Kilauea in a meaningful way for assessing environmental impact, we made a series of replicate grab-sample measurements of ambient air and precipitation at the summit of Kilauea, along its ERZ, and at coastal sites where lava enters the ocean. The grab-sampling data combined with SO_2 emission rates, and continuous air quality and meteorological monitoring at the summit of Kilauea show that the effects of these emissions on ambient air character are a complex function of chemical reactivity, source geometry and effusivity, and local meteorology. Prevailing tradewinds typically carry the gases and aerosols released to the southwest, where they are further distributed by the regional wind regime. Episodes of kona, or low speed variable winds sometimes disrupt this pattern, however, and allow the gases and their oxidation products to collect at the summit and eastern side of the island. Summit solfatara areas of Kilauea are distinguished by moderate to high ambient SO_2, high H_2S at one location, and low H_2S at all others, and negligible HCl concentrations, as measured 1 m from degassing point-sources. Summit solfatara rain water has high sulfate and low chloride ion concentrations, and low pH.

22253 (WHC-SD-GN-SWD–30002-Rev.1) **GXQ program user's guide. Revision 1.** Hey, B.E. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012583. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the program user's guide of a general purpose atmospheric dispersion code named GXQ. GXQ is an IBM Compatible microcomputer based program for calculating atmospheric dispersion coefficients using Hanford site specific joint

frequency data. It uses the Gaussian straight line model to calculate either an atmospheric dispersion coefficient (X/Q′) or a maximum normalized air concentration (X/Q). Several options are available to the user which alter the standard Gaussian model to allow for plume depletion, building wake, plume meander, sector averaging, gravitational settling and plume rise. Additional options control handling of the joint frequency data and output. Combinations of the above allow calculation of X/Q′ in accordance with Nuclear Regulatory Commission Regulatory Guide 1.145.

22254 (WHC-SD-W059-DR–001) **Engineer/Constructor Management Plan B-Plant Canyon Ventilation Upgrade Project W-059.** Condron, J.D. ICF Kaiser Hanford Co., Richland, WA (United States). 27 Apr 1995. 131p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011545. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the conceptual design for Project W-059, B Plant Canyon Ventilation Upgrade.

22255 (WHC-SD-WM-TI–700) **296-B-13 stack monitoring and sampling system: Annual system assessment report.** Ridge, T.M. Westinghouse Hanford Co., Richland, WA (United States). 16 May 1995. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012825. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the annual system assessment of the air pollution monitoring and sampling system for the 296-13 stack at the Hanford site. Topics discussed include; system description, system status, system aging, spare parts considerations, long term maintenance plan, trends, and items requiring action.

22256 (WSRC-TR–94-0616) **H-Area, K-Area, and Par Pond Sewage Sludge Application Sites Groundwater Monitoring Report. Fourth quarter 1994 and 1994 summary.** Chase, J.A. Westinghouse Savannah River Co., Aiken, SC (United States). Apr 1995. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060134. Source: OSTI; NTIS; GPO Dep.

Groundwater samples from the three wells at the H-Area Sewage Sludge Application Site (HSS wells) are analyzed quarterly for constituents as required by South Carolina Department of Health and Environmental Control Construction Permit 12,076. Samples from the three wells at the K-Area Sewage Sludge Application Site (KSS wells) and the three wells at the Par Pond Sewage Sludge Application Site (PSS wells) are analyzed quarterly for constituents required by SCDHEC Construction Permit 13,173. All samples are also analyzed as requested for other constituents as part of the Savannah River Site Groundwater Monitoring Program. Annual analyses for other constituents, primarily metals. also are required by the permits.

22257 (ANL–94/41) **Analytical electron microscopy characterization of Fernald soils. Annual report, October 1993–September 1994.** Buck, E.C.; Brown, N.R.; Dietz, N.L. Argonne National Lab., IL (United States). Mar 1995. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95010856. Source: OSTI; NTIS; INIS; GPO Dep.

A combination of backscattered electron imaging and analytical electron microscopy (AEM) with electron diffraction have been used to determine the physical and chemical properties of uranium contamination in soils from the Fernald Environmental Management Project in Ohio. The information gained from these studies has been used in the development and testing of remediation technologies. Most chemical washing techniques have been reasonably effective with uranyl [U(VI)] phases, but U(IV) phases have proven difficult to remove from the soils. Carbonate leaching in an oxygen environment (heap leaching) has removed some of the U(IV) phases, and it appears to be the most effective technique developed in the program. The uranium metaphosphate, which was found exclusively at an incinerator site, has not been removed by any of the chemical methods. We suggest that a physical extraction procedure (either a magnetic separation or aqueous biphasic process) be used to remove this phase. Analytical electron microscopy has also been used to determine the effect of the chemical agents on the uranium phases. It has also been used to examine soils from the Portsmouth site in Ohio. The contamination there took the form of uranium oxide and uranium calcium oxide phases. Technology transfer efforts over FY 1994 have led to industry-sponsored projects involving soil characterization.

22258 (ANL/EAD/TM–38-Vol.2) **Remedial investigation sampling and analysis plan for J-Field, Aberdeen Proving Ground, Maryland: Volume 2, Quality Assurance Project Plan.** Prasad, S.; Martino, L.; Patton, T. Argonne National Lab., IL (United States). Mar 1995. 173p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95011690. Source: OSTI; NTIS; GPO Dep.

J-Field encompasses about 460 acres at the southern end of the Gunpowder Neck Peninsula in the Edgewood Area of APG (Figure 2.1). Since World War II, the Edgewood Area of APG has been used to develop, manufacture, test, and destroy chemical agents and munitions. These materials were destroyed at J-Field by open burning and open detonation (OB/OD). For the purposes of this project, J-Field has been divided into eight geographic areas or facilities that are designated as areas of concern (AOCs): the Toxic Burning Pits (TBP), the White Phosphorus Burning Pits (WPP), the Riot Control Burning Pit (RCP), the Robins Point Demolition Ground (RPDG), the Robins Point Tower Site (RPTS), the South Beach Demolition Ground (SBDG), the South Beach Trench (SBT), and the Prototype Building (PB). The scope of this project is to conduct a remedial investigation/feasibility study (RI/FS) and ecological risk assessment to evaluate the impacts of past disposal activities at the J-Field site. Sampling for the RI will be carried out in three stages (I, II, and III) as detailed in the FSP. A phased approach will be used for the J-Field ecological risk assessment (ERA).

22259 (ANL/EAD/TM–40) **Remedial Investigation Work Plan for J-Field, Aberdeen Proving Ground, Maryland.** Benioff, P.; Biang, R.; Dolak, D.; Dunn, C.; Haffenden, R.; Martino, L.; Patton, T.; Wang, Y.; Yuen, C. Argonne National Lab., IL (United States). Mar 1995. 209p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95011691. Source: OSTI; NTIS; GPO Dep.

The purpose of an RI/FS is to characterize the nature and extent of the risks posed by contaminants present at a site and to develop and evaluate options for remedial actions. The overall objective of the RI is to provide a comprehensive evaluation of site conditions, types and quantities of contaminants present, release mechanisms and migration pathways, target populations, and risks to human health and the environment. The information developed during the RI provides the basis for the design and implementation of remedial actions during the FS. The purpose of this RI Work Plan is to define the tasks that will direct the remedial investigation of the J-Field site at APG.

22260 (ANL/ER/CP–86429) **Integration of geophysics within the Argonne expedited site characterization Program at a site in the southern High Plains.** Hastings, B.; Hildebrandt, G.; Meyer, T.; Saunders, W.; Burton, J.C. Argonne National Lab., IL (United States). [1995]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950450–8: 8. annual symposium on the application of geophysics to environmental and engineering problems, Orlando, FL (United States), 23-27 Apr 1995). Order Number DE95011792. Source: OSTI; NTIS; GPO Dep.

An Argonne National Laboratory Expedited Site Characterization (ESC) program was carried out at a site in the central United States. The Argonne ESC process emphasizes an interdisciplinary approach in which all available information is integrated to produce as complete a picture as possible of the geologic and hydrologic controls on contaminant distribution and transport. As part of this

process, all pertinent data that have been collected from previous investigations are thoroughly analyzed before a decision is made to collect additional information. A seismic reflection program recently concluded at the site had produced inconclusive results. Before we decided whether another acquisition program was warranted, we examined the existing data set to evaluate the quality of the raw data, the appropriateness of the processing sequence, and the integrity of the interpretation. We decided that the field data were of sufficient quality to warrant reprocessing and reinterpretation. The main thrust of the reprocessing effort was to enhance the continuity of a shallow, low-frequency reflection identified as a perching horizon within the Ogallala formation. The reinterpreted seismic data were used to locate the boundaries of the perched aquifer, which helped to guide the Argonne ESC drilling and sampling program. In addition, digitized geophysical well log data from previous drilling programs were reinterpreted and integrated into the geologic and hydrogeologic model.

22261 (ANL/ES/CP–85635) **Bench- and pilot-scale thermal desorption treatability studies on pesticide-contaminated soils from Rocky Mountain Arsenal.** Swanstrom, C.P. (Argonne National Lab., IL (United States)); Besmer, M. Argonne National Lab., IL (United States). 9 Mar 1995. 19p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9503161–1: 7. annual Gulf Coast environmental conference, Houston, TX (United States), 9 Mar 1995). Order Number DE95012267. Source: OSTI; NTIS; GPO Dep.

Thermal desorption is being considered as a potential remediation technology for pesticide-contaminated soils at the Rocky Mountain Arsenal (RMA) in Denver, Colorado. From 1988 through 1992, numerous laboratory- and bench-scale indirect-heated thermal desorption (IHTD) treatability studies have been performed on various soil medium groups from the arsenal. RMA has contracted Argonne National Laboratory to conduct a pilot-scale direct-fired thermal desorption (DFTD) treatability study on pesticide-contaminated RMA soil. The purpose of this treatability study is to evaluate the overall effectiveness of the DFTD technology on contaminated RMA soils and to provide data upon which future conceptual design assumptions and cost estimates for a full-scale system can be made. The equipment used in the DFTD treatability study is of large enough scale to provide good full-scale design parameters and operating conditions. The study will also provide valuable-emissions and materials-handling data. Specifically this program will determine if DFTD can achieve reductions in soil contamination below the RMA preliminary remediation goals (PRGs), define system operating conditions for achieving the PRGs, and determine the fate of arsenic and other hazardous metals at these operating conditions. This paper intends to compare existing data from a bench-scale IHTD treatability study using equipment operated in the batch mode to new data from a pilot-scale DFTD operated in a parallel-flow continuous mode. Delays due to materials-handling problems and permit issues have delayed the start of the pilot-scale DFTD testing. The first pilot-scale test is scheduled for the flat week in January 1995. The available data will be presented March 9, 1995, at the Seventh Annual Gulf Coast Environmental Conference in Houston, Texas.

22262 (CDTN-DERL-CN–020/88) **IN SITU density measurements oozy bottom of the access channel to the port of Santos, Sao Paulo, Brazil.** Minardi, P.S.P. Centro de Desenvolvimento da Tecnologia Nuclear (CDTN), Belo Horizonte, MG (Brazil). Div. de Engenharia Ambiental. Sep 1988. 24p. (In Portuguese). Order Number DE95632468. Source: OSTI; NTIS (US Sales Only); INIS.

The density of the bottom sediment of the access channel to the port of Santos, Sao Paulo, Brazil was measured. The in situ measurements aimed at verifying the use for navigation purposes of the layers with densities equal to or smaller than 1200 kg/m^3. (F.E.). 3 refs, 55 figs, 3 tabs.

22263 (CONF-9406337–Absts.) **AGU Chapman Conference Hydrogeologic Processes: Building and Testing Atomistic- to Basin-Scale Models.** Weaver, B. (American Geophysical Union, Washington, DC (United States)). American Geophysical Union, Washington, DC (United States); USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). [1994]. 27p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). From AGU Chapman conference on hydrogeologic processes: Building and testing atomistic- to basin-scale models; Lincoln, NH (United States); 6-9 Jun 1994. Order Number DE95013091. Source: OSTI; NTIS; GPO Dep.

This report presents details of the Chapman Conference given on June 6–9, 1994 in Lincoln, New Hampshire. This conference covered the scale of processes involved in coupled hydrogeologic mass transport and a concept of modeling and testing from the atomistic- to the basin- scale. Other topics include; the testing of fundamental atomic level parameterizations in the laboratory and field studies of fluid flow and mass transport and the next generation of hydrogeologic models. Individual papers from this conference are processed separately for the database.

22264 (CONF-9509121–1) **Potentially disruptive hydrologic features, events and processes at the Yucca Mountain Site, Nevada.** Hoxie, D.T. Geological Survey, Las Vegas, NV (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI08-92NV10874. From Characterizations of long term geological changes being considered for disposal sites; Paris (France); 19-21 Sep 1995. Order Number DE95009558. Source: OSTI; NTIS; INIS; GPO Dep.

Yucca Mountain, Nevada, has been selected by the United States to be evaluated as a potential site for the development of a geologic repository for the disposal of spent nuclear fuel and high-level radioactive waste. If the site is determined to be suitable for repository development and construction is authorized, the repository at the Yucca Mountain site is planned to be constructed in unsaturated tuff at a depth of about 250 meters below land surface and at a distance of about 250 meters above the water table. The intent of locating a repository in a thick unsaturated-zone geohydrologic setting, such as occurs at Yucca Mountain under the arid to semi-arid climatic conditions that currently prevail in the region, is to provide a natural setting for the repository system in which little ground water will be available to contact emplaced waste or to transport radioactive material from the repository to the biosphere. In principle, an unsaturated-zone repository will be vulnerable to water entry from both above and below. Consequently, a major effort within the site-characterization program at the Yucca Mountain site is concerned with identifying and evaluating those features, events, and processes, such as increased net infiltration or water-table rise, whose presence or future occurrence could introduce water into a potential repository at the site in quantities sufficient to compromise the waste-isolation capability of the repository system.

22265 (DMI-TR–95-5) **Forecasting ozone concentrations. Initial testing of model setup.** Svensmark, H. Danish Meteorological Inst., Copenhagen (Denmark). 1995. 29p. Order Number DE95787775. Source: OSTI; NTIS.

The report deals with current efforts at the Danish Meteorological Institute (DMI) to be able to calculate and predict concentrations levels of pollution in the troposphere, in particular to calculate ozone concentrations. A version of the EMEP-chemistry-model (European Monitoring and Evaluation Programme) has been implemented at the DMI-convex. The model optimized to include a program made to read the EMEP-emissions, and another to read the volatile organic compounds emissions from forests, annual/daily variations of sun declination and the use of meteorological data. The Trajectory-program at DMI provides input data to the Chemistry program. These data are: one or more trajectories to one or more locations, the height of the atmospheric boundary layer, the temperature at surface, the temperature in the mixing layer, precipitation and relative humidity. Typical values of the above parameters are used. Unlike previous use of the EMEP-model the height of the atmospheric boundary layer is not based on observations (historical data), but has to be predicted. Efforts have been made to determine the most accurate method. One version of the program lies on the disperse account on the convex computer. The full program (trajectory and chemistry) makes automatically two forecasts every 24 hours. The ozone concentrations calculated can be compared with the measured concentrations at Jaegersborg. The 'first generation' of the program has been tested against these measurements, with an expected poor performance.

Presently a 'new' version of the EMEP model is being developed where all the meteorological parameters are incorporated, and a full test of the programme against ozone data measured by the National Environmental Research Institute (DMU). (AB)

22266 (DOE/EA–1013) **The proposed Diagnostic Instrumentation and Analysis Laboratory, Mississippi State University.** Calscience Research Inst., Huntington Beach, CA (United States). Nov 1994. 30p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012237. Source: OSTI; NTIS; GPO Dep.

The Department of Energy (DOE) proposes to authorize Mississippi State University (MSU) to proceed with the detailed design, construction and equipping of the proposed Diagnostic Instrumentation and Analysis Laboratory (DIAL). DOE grant funds are available to the University for the limited purpose of performing preliminary studies, including analysis necessary to conduct this environmental assessment. The proposed facility would be located in the Mississippi Research and Technology Park, adjacent to the Mississippi Agriculture and Forestry Experiment Station campus in Starkville, Mississippi. Total project cost is estimated at $7,953,600. This proposed laboratory would be designed to conduct research into combustion devices related to waste management and environmental restoration that is of importance to industry and government. The proposed facility's role would be to develop diagnostic instrumentation capabilities in the area of combustion and related processes.

22267 (DOE/EA–1023) **Willow Creek Wildlife Mitigation Project. Final environmental assessment.** USDOE Bonneville Power Administration, Portland, OR (United States). Apr 1995. 138p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012132. Source: OSTI; NTIS; INIS; GPO Dep.

Today's notice announces BPA's proposal to fund land acquisition or acquisition of a conservation easement and a wildlife management plan to protect and enhance wildlife habitat at the Willow Creek Natural Area in Eugene, Oregon. This action would provide partial mitigation for wildlife and wildlife habitat lost by the development of Federal hydroelectric projects in the Willamette River Basin. The project is consistent with BPA's obligations under provisions of the Pacific Northwest Electric Power Planning and Conservation Act of 1980 as outlined by the Northwest Power Planning Council's 1994 Columbia River Basin Fish and Wildlife Program. BPA has prepared an environmental assessment (DOE/EA-1023) evaluating the proposed project. Based on the analysis in the EA, BPA has determined that the proposed action is not a major Federal action significantly affecting the quality of the human environment, within the meaning of the National Environmental Policy Act (NEPA) of 1969. Therefore, the preparation of an environmental impact statement (EIS) is not required and BPA is issuing this FONSI.

22268 (DOE/EA–1055) **Proposed center for advanced industrial processes. Washington State University, College of Engineering and Architecture.** Department of Energy, Washington, DC (United States). Div. of Electric Energy Systems. Mar 1995. 21p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012960. Source: OSTI; NTIS; GPO Dep.

The DOE proposes to authorize Washington State University (WSU) to proceed with the detailed design, construction, and equipping of the proposed Center for Advanced Industrial Processes (CAIP). The proposed project would involve construction of a three story building containing laboratories, classrooms, seminar rooms, and graduate student and administrative office space. Existing buildings would be demolished. The proposed facility would house research in thermal/fluid sciences, bioengineering, manufacturing processes, and materials processing. Under the "no-action" DOE would not authorize WSU to proceed with construction under the grant. WSU would then need to consider alternatives for proceeding without DOE funds. Such alternatives (including delaying or scaling back the project), would result in a postponement or slight reduction in the minor adverse environmental, safety and health Impacts of the project evaluated in this assessment. More importantly, these alternatives would affect the important environmental, safety, health, and programmatic benefits of the projects. The surrounding area is fully urbanized and the campus is intensely developed around the proposed site. The buildings scheduled for demolition do not meet State energy codes, are not air conditioned, and lack handicapped access. Sensitive resources (historical/archeological, protected species/critical habitats, wetlands/floodplains, national forests/parks/trails, prime farmland and special sources of water) would not be affected as they do not occur on or near the proposed site. Cumulative impacts would be small. The proposed action is not related to other actions being considered under other NEPA reviews. There is no conflict between the proposed action and any applicable Federal, State, regional or local land use plans and policies.

22269 (DOE/EA–1090) **Disbursement of $65 million to the State of Texas for construction of a Regional Medical Technology Center at the former Superconducting Super Collider Site, Waxahachie, Texas.** USDOE Oak Ridge Operations Office, TN (United States). May 1995. 76p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012964. Source: OSTI; NTIS; INIS; GPO Dep.

As part of a settlement agreement between the US DOE and the State of Texas, DOE proposes to transfer $65 million of federal funds to the Texas National Research Laboratory Commission (TNLRC) for construction of the Regional Medical Technology Center (RMTC) to be located in Ellis County, Texas. The RMTC would be a state-of-the-art medical facility for proton cancer therapy, operated by the State of Texas in conjunction with the University of Texas Southwestern Medical Center. The RMTC would use the linear accelerator assets of the recently terminated DOE Superconducting Super Collider Project to accelerate protons to high energies for the treatment of cancer patients. The current design provides for treatment areas, examination rooms, support laboratories, diagnostic imaging equipment, and office space as well as the accelerators (linac and synchrotron) and beam steering and shaping components. The potential environmental consequences of the proposed action are expected to be minor.

22270 (DOE/EM–0233) **The Formerly Utilized Sites Remedial Action Program (FUSRAP): Building stakeholder partnerships to achieve effective cleanup.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of Environmental Restoration. Apr 1995. 36p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95010337. Source: OSTI; NTIS; INIS; GPO Dep.

This booklet describes the U.S. Department of Energy's (DOE's) Formerly Utilized Sites Remedial Action Program (FUSRAP). This document describes the history of the FUSRAP program and discusses the ongoing and planned efforts to remediate FUSRAP sites. The U.S. DOE created FUSRAP in 1974 to identify, investigate, and clean up or control sites where contamination above today's guidelines remains from the early years of the nation's atomic energy programs.

22271 (DOE/MC–29103-95/C0459) **Lightguide-coupled sensor for in-situ radiation monitoring.** Reed, S.E.; Berthold, J.W. Babcock and Wilcox Co., Alliance, OH (United States). Research and Development Div. [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29103. (CONF-9506183–1: Optics for environmental and public safety, Munich Bavaria (Germany), 19-23 Jun 1995). Order Number DE95012313. Source: OSTI; NTIS; INIS; GPO Dep.

The authors are developing a multi-point radiation monitoring system for long-term, continuous monitoring of radiation levels in the vadose zone of radioactive waste sites. The system is based on gamma detection with a lightguide-coupled scintillator built into a probe buried in the ground. The lightguide transmits the visible light pulses produced by the scintillator to the surface where detection and signal multiplexing take place. The system is to be capable of monitoring large numbers of such passive probes which are to be permanently installed throughout the waste site. The authors have recently completed tests of a prototype single-probe system. In this paper, they report on the development and testing of the single-probe system.

22272 (DOE/RL–94-36-4) **Quarterly report of RCRA groundwater monitoring data for period October 1 through December**

31, 1994. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 429p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012821. Source: OSTI; NTIS; INIS; GPO Dep.

Hanford Site interim-status groundwater monitoring projects are conducted as either background, indicator parameter evaluation, or groundwater quality assessment monitoring programs as defined in the Resource Conservation and Recovery Act of 1976 (RCRA); and "Interim Status Standards for Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities" (Title 40 Code of Federal Regulations [CFR] Part 265), as amended. Compliance with the 40 CFR 265 regulations is required by the Washington Administrative Code (WAC) 173-303. This report contains data from Hanford Site groundwater monitoring projects. The location of each facility is shown. Westinghouse Hanford Company (WHC) manages the RCRA groundwater monitoring projects for federal facilities on the Hanford Site. Performing project management, preparing groundwater monitoring plans, well network design and installation, specifying groundwater data needs, performing quality control (QC) oversight, data management, and preparing project sampling schedules are all parts of this responsibility. Pacific Northwest Laboratory (PNL) administers the contract for analytical services and provides groundwater sampling services to WHC for the RCRA groundwater monitoring program. This quarterly report contains data received between October and December 1994, which are the cutoff dates for this reporting period. This report may contain not only data from the October through December quarter, but also data from earlier sampling events that were not previously reported.

22273 (DOE/SR/15160–6-Vol.1) **Hydrogeologic investigation and establishment of a permanent multi-observational well network in Aiken, Allendale, and Barnwell Counties, South Carolina. Eight-year interim report (1986-1994). Volume 1 cluster-site description.** Gellici, J.A.; Reed, R.H.; Logan, W.R.; Aadland, R.K.; Simones, G.C. South Carolina Dept. of Natural Resources, Columbia, SC (United States). May 1995. 214p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC09-86SR15160. Order Number DE95012406. Source: OSTI; NTIS; GPO Dep.

The South Carolina Department of Natural Resources, Water Resources Division (SCWRD), in collaboration with the United States Department of Energy (USDOE) is conducting a hydrogeologic investigation of the ground-water system(s) peripheral to the Savannah River Site. The study area is located in the Southeastern Coastal Plain hydrogeologic province in Aiken, Allendale and Barnwell Counties, South Carolina. Ground-water movement, quality, and availability are being evaluated in order to better protect and manage this valuable regional resource. The investigation involves a well-cluster system comparable to the one constructed on the SRS. Cluster sites are situated outside the SRS on the basis of study objectives, proximity to the plant's borders, land availability, and for the optimization of hydrogeologic control. One to three wells are completed into each major aquifer, and at each cluster site, at least one borehole is continuously cored and geophysically logged from land surface to at least 10 feet into unweathered bedrock. Data collected from the ongoing study include 146 paleontologic and palynologic age dates, 100 x-ray diffraction analyses of clay and bulk mineralogy, 442 sieve analyses, 6,040 feet of detailed core description, mineral composition and porosity determined from thin-section analyses, and continuous water-level data. This report is a compilation and interpretation of the "C-well" data that have been generated from the project and that will be used to model and characterize the aquifers and confining units in the region.

22274 (DOE/SR/15160–7-Vol.2) **Hydrogeologic investigation and establishment of a permanent multi-observational well network in Aiken, Allendale, and Barnwell Counties, South Carolina. Eight-year interim report (1986-1994). Volume 2 core description.** Gellici, J.A.; Reed, R.H.; Logan, W.R.; Aadland, R.K.; Simones, G.C. South Carolina Dept. of Natural Resources, Columbia, SC (United States). May 1995. 214p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC09-86SR15160. Order Number DE95012405. Source: OSTI; NTIS; GPO Dep.

The South Carolina Department of Natural Resources, Water Resources Division (SCWRD), in collaboration with the United States Department of Energy (USDOE) is conducting a hydrogeologic investigation of the ground-water system(s) peripheral to the Savannah River Site (SRS). The study site is located in Aiken, Allendale, and Barnwell Counties, South Carolina. Ground-water movement, quality, and availability are being evaluated in order to better protect and manage this valuable regional resource. A series of well clusters are being installed outside the SRS as is described in Volume 1 of this report. At each cluster site, at least one borehole is continuously cored and geophysically logged from ground surface to 10 feet into unweathered bedrock. This report (Volume 2) contains the core descriptions of the "C-wells" completed to date.

22275 (DOE/SR/15191–T1) **Natural resources management activities and biodiversity maintenance. Progress report, July 1, 1994–June 30, 1995.** Caudell, M.B. South Carolina Dept. of Natural Resources, Columbia, SC (United States). May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-87SR15191. Order Number DE95012444. Source: OSTI; NTIS; GPO Dep.

This progress report for the Natural Resources Management Activities and Biodiversity Maintenance for the time period July 1, 1994 - June 30, 1995 was submitted to the DOE by the South Carolina Department of Natural Resources. The activities devoted to revitilization of wildlife areas and reintroduction of various animal species to wildlife areas (such as Crackerneck Wildlife Management Area) are described. Other information regarding site characterization, land use and resource management in South Carolina is provided. Also, a description of attendence to various meetings and certification seminars is covered.

22276 (ES/ER/TM–152) **Terrestrial mapping of the Oak Ridge Reservation: Phase 1. Environmental Restoration Program.** Washington-Allen, R.A. (Oak Ridge National Lab., TN (United States)); Ashwood, T.L.; Christensen, S.W.; Offerman, H.; Scarbrough-Luther, P. Oak Ridge National Lab., TN (United States). Jun 1995. 125p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012979. Source: OSTI; NTIS; GPO Dep.

This report presents the results of the first phase in development of a habitat map of the terrestrial ecosystem on the Oak Ridge Reservation (ORR). During this phase, a satellite image of the ORR was classified into land use/land cover types, the classified image was incorporated into a geographic information system map of the ORR, and the accuracy of the map was assessed. A habitat map is a critical foundation for evaluation of the potential impact of historical (or ongoing) contamination on terrestrial biota of the ORR. The abundance and distribution of wildlife species and plant communities of concern are intrinsically linked to the abundance and distribution of habitat on which those species and communities rely. Thus, the impact of spatially discrete patches of contamination on those biota is directly proportional to the degree of overlap between habitat and contamination. Landsat 5 Thematic Mapper satellite imagery was used to create the land use/land cover map. A Thematic Mapper image consists of seven images of the same point on the earth produced by seven separate sensors, each of which detects a unique part of the electromagnetic spectrum. Separately and in various combinations, these spectral images can be correlated with vegetation type or other land cover type. The image selected for this map was from April 13, 1994, and covers 189,000 ha.

22277 (GSF–26/94) **Methods for the early recognition of substance translocations in soils on the basis of data provided by the soil information system.** Behrendt, H. (GSF - Forschungszentrum fuer Umwelt und Gesundheit Neuherberg GmbH, Oberschleissheim (Germany). Projektgruppe Umweltgefaehrdungspotentiale von Chemikalien); Steindl, H.; Morgenstern, M. GSF - Forschungszentrum fuer Umwelt und Gesundheit Neuherberg GmbH, Oberschleissheim (Germany). Projektgruppe Umweltgefaehrdungspotentiale von Chemikalien. 1994. 352p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0339275A. Order Number DE95779666. Source: OSTI; NTIS (US Sales Only).

The aim of the project was to develop the bases for recognizing environmental hazard potentials from organic and inorganic chemicals at an early stage and to verify, or develop further, methods for forecasting substance translocations in soils on the basis of data provided by the soil information system "BIS". An important step in this direction was the quantification of uncertainties that these data included and the quantification of spatial variability, as demonstrated by the investigation of selected areas. These investigations served also to detect methodical uncertainties resulting from the use of models of different complexity. (orig.)

22278 (GSF–39/93, pp. 21-29) **Measuring wet deposition in alpine high elevation sites.** Smidt, S. (Forstliche Bundesversuchsanstalt, Wien (Austria). Inst. fuer Immissionsforschung und Forstchemie); Mutsch, F. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU). Nov 1993. 578p. (In German). Sponsored by Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany). (CONF-9304291–: International symposium on the carry-over of pollutants from the atmosphere and on forest soil pollution in the ARGE ALP and ALPEN-ADRIA countries, Berchtesgaden (Germany), 27-29 Apr 1993). In *Carry-over of pollutants from the atmosphere and on forest soil pollution in the ARGE ALP and ALPEN-ADRIA countries. Proceedings.* Order Number DE95778131. Source: OSTI; NTIS (US Sales Only).

Wet deposition can add to the overall stress load of forest ecosystems. Its share in the overall deposition may fluctuate widely depending on area and altitude. A study was carried out in two higher alpine regions in order to measure the dependence of ion concentration and -carry-over on altitude. Results were compared with the results of two mountaneous regions in Bavaria, and two stations in the region of Leifers/Southern Tyrol for the period 1985-1988. Similar altitude dependence of mean ion concentration and element carry-over was found in the higher regions of the Ziller Valley and the Lavant Valley: ion concentrations decreased with increasing altitudes (exception: increasing proton concentrations) and an increase of proton carry-over with increasing altitude while the curves of sulphur and nitrogen carry-over were not very pronounced. Altitude curves of the parameters mentioned below taken in the Loisach Valley and Bad Reichenhall were different from the remaining stations. The mean quantity-weighted concentrations were as follows: 5-25mgH/l(pH:4.6-5.3), 0.5-2mg SO -S/l, 0.25-0.6mg NO -N/l, 0.25-0.8mg NH N/l. Mean annual carry-over was: 0.05-0.32 kg H/ha.a, 7-15kg S /ha.a, 7-17.5 kg N /ha.a. Comparison of the calculated mean carry-over by wet deposition of proton sulphur and nitrogen with the critical loads determined by UN-ECE showed that even at low degrees of pollution sensitive alpine forest ecosystems can be endangered by wet depositions. Precise determination of the danger to a certain site though wet deposition, however, requires a great deal of information about the site (eg. soil). In order to assess potential dangers from wet deposition of protons to forest soils in Austria one used parameters determined by the Austrian forest soil situation stocktaking study. (orig/EW)

22279 (GSF–39/93, pp. 49-57) **Carry-over of lead in the forest soils of northern and western Croatia.** Seletkovic, Z. (Forstwissenschaftliche Fakultaet, Zagreb (Croatia). Lehrstuhl fuer Waldbau); Prpic, B.; Komlenovic, N.; Rastoviski, P. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU). Nov 1993. 578p. (In German). Sponsored by Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany). (CONF-9304291–: International symposium on the carry-over of pollutants from the atmosphere and on forest soil pollution in the ARGE ALP and ALPEN-ADRIA countries, Berchtesgaden (Germany), 27-29 Apr 1993). In *Carry-over of pollutants from the atmosphere and on forest soil pollution in the ARGE ALP and ALPEN-ADRIA countries. Proceedings.* Order Number DE95778131. Source: OSTI; NTIS (US Sales Only).

A forest assessment study conducted in Croatia in 1992 found 46% of the forests to be damaged. The proportion of severely damaged trees (grade 21-4) rose from 10% in 1990 to 17% in 1992. In terms of her damaged forests Croatia has closed ranks with the most industrialised countries of Europe. The causes of tree death are studied intensively, this includes the lead contents in soil forests. In the course of 1992 we studied 54 areas out of the 16x16 grid. Here, we present the results of 28 test areas in beech forests. Soil samples were taken from micro locations near the foot of the beech trees, samples for comparison were taken from oh and ah horizons. In most areas lead concentrations at the foot of the tree were considerably higher than comparative values from the other samples. Mean lead concentration for 28 areas for of-horizons were 69.7mg Pb/kg, ah- horizon 55.4mg Pb/kg and values at microlocation were 152.4 mg Pb/kg and 11.4 mg Pb/kg. Forests in northern and western Croatia are most exposed to carry-over of lead. Especially in the forests of western Croatia this phenomenon is very prominent and increases with altitude. The link between lead concentration in the soil and altitude is clearly to be seen from the comparison of micro locations at both horizons (comparison -rof=0.72; rAh - 0.81, foot; rOf - 0.72; rAh = 0.76). In this report we relate tree damage and pollution and also look into other reasons of damage to forests. The forests of the western part of the country are the most damaged forests of the whole country. Damage of beeches and other trees increases with sea level. This, however, is not to say that lead content in the soil directly influences the state of the forest. (orig/EW)

22280 (GSF–39/93, pp. 64-77) **Chemism of wet deposition in the Italian Alps.** Mosello, R. (CNR Italienisches Inst. fuer Hydrologie, Pallanza (Italy)); Della Lucia, M.; Marchetto, A.; Tartari, G.A. State-wide monitoring systems in Baden-Wuerttemberg show that in large forest areas the soil's balancing function which assures balanced nutrition with potassium and/or magnesium is obviously limited. High reserves of nutrient in top soils can keep the nutrient cycle intact if general climatic conditions are favourable but the whole system becomes more destabilised and more dependent on natural and anthropogenic fluctuations or changes of factors at the location. In large areas present rates of deposition of forests overtax the forests' own buffer systems of digestions so that atmogenic immission-induced drift becomes likely. The intensity of these changes is obvious from the lowering of Ph-values on locations with sandstone over the last 70 years. Ph-values measured by

FRANK on 83 sandstone locations show that in 1927 the median of ph-distribution at 5 cm soil depth was ±6 and only a minor part of the frequency distribution was to be found in Ph-ranges where podsolation may take place. Ph-values measured at 63 sand stone profiles in 1992 show a completely different picture. The median of the frequency distribution is ±3.5, podsolation is now possible at all sites. Methodical effects cannot explain this divergence as ph-values of 1927 and 1992 do not differ on granite sites. Apart from the Ph-milieu we assume that carry-over of N most intensively changes the situation in forests. Nitrogen is the key element for an "unspecific triggering" of growth. This increases the need for neutral cations like Ca, K and Mg. Available resource of these elements however are scarce due to carry-over of acid and losses through utilisation. In many cases sufficient nutrition can only be managed by means of intensive root formation in the top soil. Especially ammonia act as acid carrier and this creates a divide of nutrition where even at normal growth rates forests become prone to nutritional disturbancies which may be triggered for instance by climatic stresses. Risk assessment of anthropogenic and natural stress factors on the protected forests of the Alpine valleys is described. Assessment of carry-over over several decades makes it possible to indicate the risk in terms of actual load for individual parameters. Large spatial and temporal superposition of scales creates the necessity of using a great number of models each of which is adapted to a particular scale and show correct parametrisation. Evaluation of all risks that can be characterised in terms of a weighted synergistic overall risk for plant physiology will require intense additional efforts. (orig./EW).

The nationwide inventory of the state of forest soils is part of a project of the Austrian Monitoring system of damage to forests and also part of the network of Austrian forest inventory. The extent of the inventory corresponds to Level II of the ECE-agreements on soil studies plus plant sociology, methods have been harmonised with those used within the ECE. 35% of all forest soils are influenced by carbonate, about 40% are quite able to withstand acidification. 23% show a high degree of acidification in the top soil and they are also drained of alkalines. About half of these soils are naturally acid for the other half we assume secondary acidification. Another group of soils show alkaline saturation which is just about satisfactory but these a prone to acidification. 10% of the soils are disposed to Mg-shortage. Effects of increased carry-over of N are not yet recognisable but a lack of N is widespread. Pb and Cd contents are often increased. Relative enrichment in humic topsoils and artificially applied humus as well as the significant increase of contents with sea level point to accumulation of Pb and Cd transported over large distances over large areas. Other heavy metals were measured but showed no significant increase, Zn and Cu tend to be scarce. (orig./EW).

A pilot study on 100 selected forest soils was carried out in order to prepare a forest soil inventory in Switzerland. Soil profiles are located in five regions: Jura, Central area, pre-Alpine region, Alps and southern side of the Alps. The element lead is used to describe the possibilities of interpreting the element content found in the profile soils are influenced and draw conclusions with respect to anthropogenic soil pollution. The regulation on soil pollutants lists maximum values for 11 elements which apply to the content of a mixed sample from the top 20 cam of the soil. Nitric acid and sodium nitrate are recommended as extractants. Some problems

occured in assessing soil element contents on the basis of this regulation: all anorganic pollutants mentioned in the regulation are natural elements which occur in all soils in widely varying concentrations. Composition of the parent rock and resulting background concentrations therefore play a major role. Element contents in microsoils may also be strongly influenced by processes in the soil. De- and enrichment of elements compared to the parent rock can be estimated on the basis of the relative mobility of an element. Against this background it becomes clear that soil pollution can not be assessed on the basis of top soil samples alone. Only the distribution of an element across a whole profile allows to assess the proportion of the lithogenic share and an overall soil pollution. The results of the pilot study also showed that the profile data can only be interpreted properly if the extractants suggested in the regulation (nitric acid as strong and sodium nitrate as weak extractor) are supplemented by a "medium" extractor. We suggest to use ammonia-acetate-EDTA (see Lakanen and Ervioe.) The advantage of this method is that it does not affect non-weathered rock (except lime). Element contents extracted with this method allow better conclusions as to pedogenic and anthropogenic influences. (orig./EW)

This paper contains the results of a project carried out by the Federal Ministry of Research and Technology on "Soil research in the German Alpine Region". The water load in two forested small catchment areas in the Tegernsee Alps was studied in the compartments input, soil and output. The input is characterised by small overall deposition rate of proton and sulphur which total 0.6 kg H and 16 kg S ha^{-1} a^{-1}, but high overall deposition of N of up to 32 kg ha^{-1} a^{-1}. In the soil, the deposited nitrogen is almost completely transferred (plant absorption, microbial processes) and a strong release of Ca. Due to silicate weathering concentration of Si in the soil solution shows strong increase with rising depths. Subsequent decrease of 50% in receiving streams compared to soil solutions at a depth of 50 cm point to precipitation of silicate and new formation of minerals in the deeper decomposition hone. Output in receiving streams shows strong export of the alkaline cations Ca, Mg and Na with hydrogen carbonate as the corresponding anion. Protons, sodium and nitrogen are accumulated in the ecosystem. (orig./EW).

The input of free acids in the central and northern Appenine mountains is low and gets almost fully neutralised on its path through the vegetation. Nitrogen penetrating the ecosystem is largely accumulated. Soil solutions show low acidities and low aluminium contents. Formation of chelates of organic pollutant and stratification of vermiculite account for Al-immobilisation. At Monte Mottarone too, acid input which is considerably higher but neutralised during transition through the vegetation. A greater part of the ammonia is accumulated in the soil, a considerable output of nitrate takes place. This leads to strong acidification and mobilises large amounts of aluminium. (orig./EW).

Soil- and needle samples from fifty spruce stands stratified according to topography and soil water household and vitality characteristics of trees were analysed in order to determine the influences of general site parameters on soil properties, vitality and mineral nutrition of spruce stands under the influence of air pollutants with long-term effects. The multivariate statitical evaluation of the data showed a clear dependence of soil nutrient reserves on type of site and topography; soils in mountain top areas and at soils exposed to main wind directions were found to be most acidified. Lead accumulation in topsoils can be used as an indicator of immission, there is a clear link with sea levels and special pollution of exposed areas which leads us to the assumption that immissions play a role in soil acidification of these areas. Nutrition and vitality of these stands also correlates with general site parameters. Magnesia supply, which is most important for tree vitality is explained by soil parameters such as pH-value and magnesia reserves of the exchanger. Multiple regression models were used to gain information on the soil status of larger areas, provided that general site paramenters obtained from existing data such as the digital altitude model and site and stand maps are available. (orig./EW).

Deposition of nitrogen (NH_4^+, NO_3^-) was measured in several Swiss regions (transect Jura-Alpine region) in the open country (bulk) and in the canopies of spruces. The nutritional situation of beeches and spruces was studied at the same time. These studies were conducted over several years and show that the different regions have very different levels of N-carry-over. Nutrient studies carried out in 1984, 1987 and 1991 in the same tree collective of beeches and spruces in 60 areas under permanent monitoring show a significant increase of the N-content and a decrease of P- and Mg-contents in leaves and needles. As on results of N-increasing tests by means of appropriate forest shrubs we can assume that N-carry-over has an influence on the changing nutritional status of forest trees. (orig./EW).

Carry-over and carry-out of pollutants were monitored over a period of 2 years in a 140-year old spruce stand in the Kalkalpen at an altitude of 800 m above sea level. Of the annual precipitation of 1243 mm one third is accounted for by evaporation though interception, half goes into the groundwater, one sixth is directly given back by evapotranspiration of plants and soil. Carry-over of all ions (H^+, Na^+, K^+, Mg^{2+}, Ca^{2+}, NH^+, NO_3^-, Cl^-, SO_4^{2-}) proved to be so small that there is not recognisable pollution from carry-over of pollutants. There is a higher carry-out of Ca (23 keq*ha^{-1}*a^{-1}) only 7% of this can be accounted for by the carry-over of proton equivalents, more than 90% are due to carbonate dissolution and internal acid production in the soil due to high CO_2-concentrations. Development of soil acidity is therefore not controlled by acid carry-over bu t by internal processes of the system. Carry-over of nitrogen by precipitation on the stand it 18.7 kg*ha^{-1}*a^{-1}, of this NO_3-N: 10.4kg*ha^{-1}*a^{-1}, carry-out of N is 8.5 kg*ha^{-1}*a^{-1}. As the gaseous nitrogen balance is not known it is difficult to assess the N-household. Taking into account the insufficient supply of nitrogen to the spruces and the fact that at altitudes of 800 to 1700m above sea level there is a negative link between N-reserves in the soil and needle losses of spruces N-deposition at present cannot be assumed to have a negative effect on the forest. (orig./EW).

Critical loads of acid carry-over in forest soils and surface water were calculated and mapped all over Europe within the programme "Mapping of Critical Loads and Levels" of UN-ECE. National results were mostly determined with the stationary mass balancing method which gives a simplified description of the chemical processes in the soil leading to acidification. The first results obtained with this method show that in Central Europe – especially in the Alpine regions and some forested areas in Germany with high amounts of precipitation – there are cases of unreasonably high critical loads which may not be able to ensure protection of sensitive ecosystems. Germany, Switzerland and Austria are the most affected states. They thried to improve the results by modifying the stationary mass balancing method. In March 1992 a workshop on this subject was held at the Federal Environmental Office in Vienna. Precise specification or variation of essential parameters of the mass balancing method (e.g. weathering rate) afforded improvements in terms of lower critical loads. Finally, we present an estimate on the influence of acid carry-over on growth losses. The results were obtained from a Swedish multi-layer soil model (PROFILE). (orig./EW)

GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU). Nov 1993. 578p. (In German). Sponsored by Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany). (CONF-9304291–: International symposium on the carry-over of pollutants from the atmosphere and on forest soil pollution in the ARGE ALP and ALPEN-ADRIA countries, Berchtesgaden (Germany), 27-29 Apr 1993). In *Carry-over of pollutants from the atmosphere and on forest soil pollution in the ARGE ALP and ALPEN-ADRIA countries. Proceedings.* Order Number DE95778131. Source: OSTI; NTIS (US Sales Only).

The interdisciplinary project "Ecosystem Studies in the Kalkalpin Alpine region - altitude profile Achenkirch" organised by the Bundesversuchsanstalt is the follow-up project of the "Altitude profile Zillertal" project whithin which the ecosystem of the Kalkalps has been continously studied since 1990. By including different reseach branches and by interdisciplinary evaluation of results one attempts to make a contribution to the protection of forests especially in terms of reafforestation in high altitudes and dynamics of forest ecosystems. Indicator values which characterise stresses of the ecosystem will be set up in order to provide a basis for legal measures. (orig./EW)

22299 (GSF–39/93, pp. 437-447) **Investigations of geochemical processes in oak stands, with particular regard to the deposition of atmospheric pollutants.** Berger, T.W. (Inst. fuer Waldoekologie, Univ. fuer Bodenkultur, Wien (Austria)). GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU). Nov 1993. 578p. (In German). Goechemical processes in declining Cental European oak ecosystems (Quercus petraea and Q. robur) were studied in two oak stands of the Weinviertel, Lower Austria, about 30 km north of Vienna. Stores of chemical elements were determined by soil and biomass inventories. Deposition input was monitored over a two-year period by bulk sampling of throughfall. Soil solution chemistry was studied by tension lysimetry over a one-year period. Mineral nutrition of oak was judged by foliar analysis. Bulk deposition rates were 10 - 12 kr $N.ha^{-1}.a^{-1}$, and 15 - 20 kg $S.ha^{-1}.a^{-1}$. Both systems can be assumed to be S-saturated. Based on this assumption, the total nitrogen gain was estimated as 12 kg $N.ha^{-1}.a^{-1}$ at one site and 21 kg $N.ha^{-1}.a^{-1}$ at the second. Both systems lose calcium and magnesium. Foliar nutrient levels indicate sufficient nutrition with main mineral nutrients, except for magnesium, which is in moderately low supply. Based on these findings, the hypothesis that pollutant deposition is the cause of a sudden and severe appearance of decline symptoms in the second half of the 1980ties, must be dismissed. The data on deposition rates and ecosystem nutrient status, however, indicate, that the soil of both systems is acidifying, nitrogen stores are increasing, and magnesium pools are depleted. If deposition of pollutants continues at current rates, a slow but steady degradation of many oak ecosystems in the Austrian Weinviertel is inevitabel. (orig.)

In *Carry-over of pollutants from the atmosphere and on forest soil pollution in the ARGE ALP and ALPEN-ADRIA countries. Proceedings.* Order Number DE95778131. Source: OSTI; NTIS (US Sales Only).

The atmospheric sulphur deposition in the Erzgebirge today (found as carry-over in precipitations below canopy level)is not extremely increased compared to the values indicated for spruce stands in Europe even though air pollution in the Czech Republic is significantly higher. The reason for this is mostly likely the thinning of the canopy which cannot absorb pollutants efficiently any more. In younger, well kept stands atmospheric deposition is almost twice as high as in old damaged stands. The present amount of atmospheric deposition in old spruce stands is not worrying even though it is probable that unless today's pollution levels can be reduced, younger forests will be damaged by the high atmospheric deposition. (orig./EW)

22301 (GSF–39/93, pp. 474-480) **Concentrations of minerals in ombrogenous peat bog lays as an indicator of recent and past deposition.** Goerres, M. (Inst. fuer Botanik, Univ. Hohenheim, Stuttgart (Germany)). GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU). Nov 1993. 578p. (In German). Sponsored by Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany). (CONF-9304291–: International symposium on the carry-over of pollutants from the atmosphere and on forest soil pollution in the ARGE ALP and ALPEN-ADRIA countries, Berchtesgaden (Germany), 27-29 Apr 1993). In *Carry-over of pollutants from the atmosphere and on forest soil pollution in the ARGE ALP and ALPEN-ADRIA countries. Proceedings.* Order Number DE95778131. Source: OSTI; NTIS (US Sales Only).

The ash and element content (22 elements) of ombrogenous peat bog lays was determined for six southern German and various central and northern European peat bogs in higher altitudes. Depth profiles show a clear connection between anthopogenic substance carry-over (agriculture, clearing) and increased ash- and element contents. Pb-contents of the upper layers of the peat bogs are clearly higher in industrialised regions. Pb-contents increase with precipitation. The change of vegetation observed in many ombrogenous peat bogs and the increasing growth of trees can be related to increased contents of ash and elements. Further reduction of emissions is desirable for the sensitive ecosystems of peat bogs. (orig./EW)

22302 (GSF–39/93, pp. 494-498) **Regional estimation models for carry-over of pollutants and forest soil pollution in Southeastern Bavaria.** Lenz, R. (GSF - Forschungszentrum fuer Umwelt und Gesundheit, GmbH, Projektgruppe Umweltgefaehrdungspotentiale von Chemikalien (PUC), Neuherberg,

Nov 1993. 578p. (In German). Sponsored by Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany). (CONF-9304291–: International symposium on the carry-over of pollutants from the atmosphere and on forest soil pollution in the ARGE ALP and ALPEN-ADRIA countries, Berchtesgaden (Germany), 27-29 Apr 1993). In *Carry-over of pollutants from the atmosphere and on forest soil pollution in the ARGE ALP and ALPEN-ADRIA countries. Proceedings.* Order Number DE95778131. Source: OSTI; NTIS (US Sales Only).

Three maps are presented which were drawn on the basis of a geographic information system and regional estimation models for Southeastern Bavaria. The following characteristics and pollutions of forest ecosystems which are relevant for the metabolism in the medium and longterm: deposition risk classes for protons, weathering rates (classes) for soils, long-term pollution risks of acid carry-over. 41% of the forest area shows a low risk, and 6% show a mean risk of acidification due to pollution carry-over from air. These results must be seen as preliminary, regional mean values. (orig./EW)

22305 (IC–95/51) **Using saturation water percentage data to predict mechanical composition of soils.** Mbagwu, J.S.C. (International Centre for Theoretical Physics, Trieste (Italy)); Okafor, D.O. International Centre for Theoretical Physics, Trieste (Italy). Apr 1995. 16p. Order Number DE95633181. Source: OSTI; NTIS (US Sales Only); INIS.

One hundred and sixty-six soil samples representing eleven textural classes and having wide variations in organic matter (OM) contents and other physico-chemical properties were collected from different locations in southeastern Nigeria to study the relationship between mechanical composition and saturation water percentage (SP). The objective was to develop a prediction model for silt + clay (SC) and clay (C) contents of these soils using the SP values. The magnitude of the correlation coefficients (r) between SC or C and SP was dependent on the amount of organic matter (OM) present in the soils. For soils with $\leq$ 1.00% OM, the correlation (r) between SC and SP was 0.9659 ($p \leq 0.001$) and that between C and SP was 0.9539 ($p \leq 0.001$). For soils with $\geq$ 2.00% OM, the 'r' values were generally low, varying between 0.5320 and 0.2665 for SC and 0.6008 and 0.3000 for C. The best-fit regression models for predicting SC and C were developed with soils having $\leq$ 1.00% OM. An independent data set from 25 soil samples collected from other parts of the study area was used to test the predictive ability of the best-fit models. These models predicted SC and C accurately in soils having between 0.28 and 1.10% OM, but poorly in soils having between 1.31 and 3.91% OM. These results show that the use of saturation water percentage to predict the mechanical composition of soils is most reliable for soils with low ($\leq$ 1.00%) OM contents. 22309 (INP–1615/D) **Natural factors of ^{137}Cs redistribution in soil (case study from the Carpathian Foothills).** Chelmicki, W. (Uniwersytet Jagiellonski, Cracow (Poland)); Swiechowicz, J.; Mietelski, J.W.; Macharski, P. Institute of Nuclear Physics, Cracow

(Poland). 1993. 19p. Order Number DE95632292. Source: OSTI; NTIS; INIS.

Pre- and post-Chernobyl accident.

Total ^{137}Cs as well as the pre- and post-Chernobyl ^{137}Cs redistributions in soil for the single forester slope situated in the Carpathian Foothills were analysed according to the relief conditions, humus content and soil permeability. It was found that in spite of the relatively uniform environmental conditions the ^{137}Cs redistribution is not uniform. This could be attributed to geomorphic processes such as soil erosion on slope (which is most intensive on the convex-shaped midslope) and to the soil deposition at the foot and the valley bottom. The ^{137}Cs activity correspond to the humus content and, to some extent, to the soil permeability. The role of other factors in the vertical migration of the isotope remains unknown. (author). 11 refs, 8 figs, 7 tabs.

22310 (JAERI-Research–95-024) **Studies on sorption behaviour of technetium in soils.** Takebe, Shinichi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Xia Deying. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 19p. Order Number DE95780611. Source: OSTI; NTIS; INIS.

The technetium sorption behaviour in different soils has been studied by batch experiments under aerobic conditions. The soil samples characteristics and soil preequilibrium water properties of pH-Eh have been also investigated. In addition, the activated carbon and reduced iron powder have been selected as the additives to the JAERI sand according to the research work, and the technetium sorption behaviour in the artificial soils has been studied in the similar conditions. The experiment results show that all soils except for gley soil have little distribution coefficient for Tc, while the artificial soils have very high distribution coefficient for Tc. The distribution coefficient Kd values have an increase trend with the additive increase in artificial soils and contact time. Physicochemical processes of fixation and possible sorption modes are discussed as well. (author).

22311 (LA-SUB–95-27-1) **SAMFT1D: Single-phase and multiphase flow and transport in 1 dimension. Version 2.0, Documentation and user's guide.** Wu, Y.S. (HydroGeoLogic, Inc., Herndon, VA (United States)); Huyakorn, P.S.; Panday, S.; Park, N.S.; Kool, J.B. Los Alamos National Lab., NM (United States); HydroGeoLogic, Inc., Herndon, VA (United States). Sep 1991. 297p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95007639. Source: OSTI; NTIS; GPO Dep.

This report documents a one-dimensional numerical model, SAMFT1D, developed to simulate single-phase and multiphase fluid flow and solute transport in variably saturated porous media. The formulation of the governing equations and the numerical procedures used in the code for single-phase and multiphase flow and transport are presented. The code is constructed to handle single-phase as well as two or three-phase flow conditions using two integrated sets of computational modules. The fully implicit scheme is used in the code for both single-phase and multiphase flow simulations. Either the Crank-Nicholson scheme or the fully implicit scheme may be used in the transport simulation. The single-phase modules employ the Galerkin and upstream weighted residual finite element techniques to model flow and transport of water (aqueous phase) containing dissolved single-species contaminants concurrently or sequentially, and include the treatment of various boundary conditions and physical processes. The multiphase flow modules use block-centered finite difference techniques to simulate two or three-phase flow problems, and treat different boundary conditions in terms of source/sink terms fully implicitly. Whereas the multiphase solute transport modules employ finite element schemes to handle single-species transport in multiphase fluid systems. This document has been produced as a user's manual. It contains detailed information on the code structure along with instructions for input data preparation and sample input and printed output for selected test problems. Also included are instructions for job set up and simulation restart procedures.

22312 (LBL–36807) **Transient dual-porosity simulations of unsaturated flow in fractured rocks.** Zimmerman, R.W.; Hadgu, T.; Bodvarsson, G.S. Lawrence Berkeley Lab., CA (United States). Jan 1995. 112p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95012438. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the development and use of a semi-analytical dual-porosity simulator for unsaturated flow in fractured rock masses. Fluid flow between the fracture network and the matrix blocks is described by a nonlinear equation that relates the imbibition rate to the local difference in liquid-phase pressure between the fractures and the matrix blocks. This equation is a generalization of the Warren-Root equation, but is accurate in both early and late time regimes. The fracture/matrix interflow equation has been incorporated into a computational module that acts as a source/sink term for fracture elements; this module is compatible with the unsaturated flow simulator TOUGH. Flow processes are then simulated using only fracture elements in the computational grid. This semi-analytical dual-porosity module has been tested with TOUGH on various problems involving transient flow in fractured/porous media, and compared with simulations performed using explicit discretization of the matrix blocks. The new semi-analytical dual-porosity model accurately simulates flow processes in unsaturated fractured rocks, and typically requires an order of magnitude less computational time than do simulations using fully-discretized matrix blocks.

22313 (LBL–36825) **A joint Russian-American field test at the Chelyabinsk-65 (Mayak) Site: Test description and preliminary results.** Wollenberg, H. (and others); Tsang, C.F.; Frangos, W. Lawrence Berkeley Lab., CA (United States). May 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (RAC–12; CONF-950917–11: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95012351. Source: OSTI; NTIS; INIS; GPO Dep.

In September 1994, a Russian-American team conducted hydrogeological, geochemical, geophysical, and radiometric measurements in the territory of the Mayak Production Association. The primary purpose of these operations was to examine the groundwater plume moving from Lake Karachai toward the river. Activities encompassed isolation of hydrologic intervals in two wells and production of water from these intervals, to compare isolated versus open-well sampling methods; surface and soil-water sampling, accompanying radiometric measurements and subsequent chemical analyses; and electrical resistivity profiling in areas of expected contrasting resistivity. Preliminary results indicate that (1) ^{60}Co and ^{137}Cs are present in small concentrations in water of the Mishelyak River, (2) analyses of water samples collected by a downhole sampler and of water produced from packed-off intervals agree within limits of laboratory accuracy, attesting to the efficacy of the sampling methods presently used by the Russian workers; and (3) strong contrasts occur between the electrical resistivities of soil and bedrock. Further collaborative work is strongly recommended, and should include more detailed isolation of intervals in wells by multi-packer installations, to better determine the geochemical and hydrological characteristics of the Karachai-Mishelyak system; deployment of a broader soil-water and soil sampling array; a more detailed examination of the distribution and concentration of radionuclides by high-resolution field gamma spectrometry; and a detailing of the area's electrical resistivity setting, using a mobile electromagnetic measurement system.

22314 (LBL–36831) **Discriminating effects of heterogeneity and matrix diffusion by alternative tracer designs.** Tsang, Y.Y.W. Lawrence Berkeley Lab., CA (United States). Mar 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95012376. Source: OSTI; NTIS; GPO Dep.

Flow and transport calculations are carried out by numerical simulation for different tracer designs: single-well radially diverging/converging (huff-puff), single well radially converging, and two-well injection-withdrawal (doublet) in a 2D fracture zone. The fractured rocks are conceptualized as a dual-continuum: the well-connected fractures forming a heterogeneous continuum for advective transport, and the less permeable matrix forming a second continuum for tracer diffusion. Results show that the huff-puff design can be a

good diagnostic test for matrix diffusion. The two-well doublet design averages over a large volume and corrects for the extreme sensitivity to spatial heterogeneities of the single well converging test, but requires prior knowledge of presence or absence of matrix diffusion to give reliable estimate of transport parameters. Results of this study demonstrate that using a suite of different tracer designs is important to reduce the uncertainty in association with solving the inverse problem of tracer test interpretation to characterize transport in fractured rocks.

22315 (LBL–37004) **Degassing and two-phase flow pilot hole test report.** Geller, J.T. (Lawrence Berkeley Lab., CA (United States)); Jarsjoe, J. Lawrence Berkeley Lab., CA (United States). Mar 1995. 87p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95012361. Source: OSTI; NTIS; GPO Dep.

A pilot hole test was conducted to support the design of the Degassing of Groundwater and Two-Phase Flow experiments planned for the Hard Rock Laboratory, Aespoe, Sweden. The test consisted of a sequence of constant pressure borehole inflow tests (CPTs) and pressure recovery tests (PRTs) in borehole KA2512A. The test sequence was designed to detect degassing effects from the change in transmissivity, or hydraulic conductivity, and storativity when the borehole pressure is lowered below the groundwater bubble pressure. The entire 37.3m of the borehole section was tested without packers. Flow response to pressure changes in CPTs occurred rapidly. Flowrates fluctuated before attaining a steady trend, probably due to effective stress changes when borehole pressure was reduced for the first time. These factors decreased the sensitivity of type-curve fits to values of specific storage. The relationship between borehole pressure and steady-state flowrates was linear over borehole pressures of 1500 kPa (abs) down to 120 kPa (abs) during testing in December 1994, indicating that processes that may change hydraulic conductivity at low borehole pressures, such as degassing, calcite precipitation or turbulence, did not occur to a measurable degree. Test results during January and February of 1995 suggest that degassing may have occurred. The hydraulic conductivity measured at a borehole pressure equal to 120 kPa (abs) was 20% lower than the hydraulic conductivity measured at a borehole pressure of 1500 kPa (abs); the latter value was 10% lower than the hydraulic conductivity measured in December, 1994. The volumetric gas content measured during this time was 1% v/v. Pressures in monitoring well KA2511A responded to the testing in KA2512A. Step-changes in flowrates coincided with blasting at 3300-3400 m tunnel length. The magnitude of these changes was greater at the lower borehole pressures. Step increases in pressures in KA2511A also coincided with the blasts.

22316 (NEI-DK–1990) **Heavy metal migration in soil. An experimental evaluation at two metal recycling industries.** Arbejdsrapport fra Miljoestyrelsen, 16. Jensen, D.L. (Technical University of Denmark. Institute of Environmental Science and Engineering, Lyngby (Denmark)); Holm, P.E.; Christensen, T.H. Miljoestyrelsen, Copenhagen (Denmark). 1995. 60p. Order Number DE95779154. Source: OSTI; NTIS.

Laboratory and field investigations were made at two metal recycling sites in order to evaluate the risk of heavy metal migration to groundwater. The top soils at both sites contained very high concentrations of lead, copper and zinc, high concentrations of nickel, cadmium and chromium and somewhat elevated concentrations of many other metals. Investigations focused on lead, copper and zinc. The leachate from soils representing different metal recycling activities at the sites (scrap cutting, car-battery destruction, cable burning and general activities including storage) as obtained from column leaching test in the laboratory showed in most cases only slightly elevated concentrations of dissolved metals (< 10 times) as compared to the leachates from uncontaminated reference soils. Soil and soil water sampled at several profiles at the two metal recycling sites confirmed the indications obtained from the leaching tests: The metals had migrated less than 0.5 m below the surface during approximately 25 years of activity at the sites, except at the car-battery destruction locations. The investigation concludes that the risk of metal migration to the groundwater is limited as long as pH stays high in the top soils containing very high metal concentrations. The now abandoned car-battery destruction directly on the ground surface has lead to very high concentrations of metals in the soil and migration of metals that may affect the groundwater. However, the extend of the metal plume in the groundwater was not investigated. (EG)

22317 (NEI-DK–2020) **Bioremediation of contaminated soil. Development and application of technologies.** Arbejdsrapport fra Miljoestyrelsen, 4/1995. Aamand, J (Water Quality Institute (Denmark)); Jensen, B.K.; Kvistgaard, M. Miljoestyrelsen, Copenhagen (Denmark). 1995. 58p. Order Number DE95787782. Source: OSTI; NTIS.

Bioremediation is a technology for remediation of soil contaminated by hazardous waste chemicals. The application of specific degrading bacteria for the treatment of polluted soil is emphasized. The current market and regulatory framework related to bioremediation are evaluated. Soil polluted by benzene, toluene, ethylbenzene, xylene (BTEX) and light fuel oil often contains indigenous hydrocarbon-degrading bacteria, and degradation is limited by the availability of oxygen or other factors. The degrading biomass may be inhibited or absent in soil heavily polluted by creosote or coal tar, and inoculation may initiate the degradation process. An inoculum may include a range of different bacterial strains. Fungi are more versatile. The degradation of tetrachloroethylene, trichloroethylene, and 1,1,1-trichloroethane in the environment is limited by the lack of effective degrader organisms. A TCE-degrading bacteria that grows on lactate has been constructed by genetic engineering, and research is being carried out to develop a bacteria with the capability to use the chlorinated aliphatics as growth substrates. Deviations in national guidelines for treatment of contaminated soil may inhibit the technical development of a bioremediation technology. Acceptance of high levels of rest contaminations in particular regions attract foreign soil, creating trans-national transport of polluted material. Prices of treatment are kept artificially low, and competitive incentives, such as technical developments, are inactivated. For easily degradable compounds such as BTEX and light fuel oil the advantages of inoculation of soil with specific degrading organisms are limited. (AB) (19 refs.)

22318 (NILU-OR–17/94, pp. 159-160) **Critical loads for forest soils: acid deposition, nitrogen saturation and forest vitality.** Frogner, T. (Norwegian Forest Research Inst. (Norway)); Wright, R.F.; Nellemann, C.; Esser, J.M.; Cosby, B.J. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9403229–: Long-range transported pollutants. Supplies, effects and critical loads, Grimstad (Norway), 7-9 Mar 1994). In *Long-range transported pollutants. Supplies, effects and critical loads.* 210p. Order Number DE95779285. Source: OSTI; NTIS.

Acid deposition damages lakes, forest soils and vegetation: Reduction in the emissions of S and N are required. Protocols within the framework of United Nations Economic Commission for Europe are being negotiated to reduce the emission of sulphur and nitrogen based on the concept of critical load. Acidification of lakes and damage to fish is well correlated with critical loads for water. The link between defoliation and critical loads for forest soils, however is more difficult to establish. The dynamic model MAGIC is used to calculate the critical loads for forest soils for present-day acid deposition and future scenarios of deposition and nitrogen retention. MAGIC includes time-dependent aspects such as cation exchange and anion adsorption, and also forest growth. The calculations are based on soil survey data of NIJOS, the atmospheric data of NILU, the forest productivity data of NIJOS, and the surface water chemistry data of NIVA. The criterion used was that the Ca/Al-molar ratio in soil solution should not fall beneath 1.0 in the uppermost 50 cm of soil for at least 50 years into the future. 2 refs.

22319 (NILU-OR–17/94, pp. 201-205) **Factor analysis of NMHC and ozone measured at Birkenes in South Norway.** Solberg, S. (Norwegian Inst. for Air Research, Kjeller (Norway)); Stordal, F.; Schmidbauer, N.; Pedersen, U. Norsk Inst. for Luftforskning, Kjeller (Norway). Mar 1994. (CONF-9403229–: Long-range transported pollutants. Supplies, effects and critical loads, Grimstad (Norway), 7-9 Mar 1994). In *Long-range transported pollutants. Supplies, effects and critical loads.* 210p. Order Number DE95779285. Source: OSTI; NTIS.

The seasonal and geographical distribution of sources of NMHC (non-methane hydrocarbons) was estimated from the measurements at Birkenes in Southern Norway by use of factor analysis. The correlation between surface ozone and NMHC was also studied. Nine hydrocarbons and ozone were grouped into different factors each season, and the relative significance of the factors in different transport sectors was calculated. The most significant factor in all the four seasons was the 'unburned fuel factor', consisting of butanes and pentanes, which in some seasons was mixed with engine exhaust components. Ozone was anticorrelated with the 'traffic factor' in autumn and winter and positively correlated with this factor in summer. The unburned fuel factor was relatively more important in the transport sector SW, while the traffic factor was more important in the sectors S and SE. 5 refs., 2 figs., 2 tabs.

22320 (NILU-OR–25/94) **Terrestrial monitoring programme. Monitoring of chemical precipitation connected to field research areas 1993.** Toerseth, K.; Roestad, A. Norsk Inst. for Luftforskning, Kjeller (Norway). May 1994. 72p. (In Norwegian). Order Number DE95779276. Source: OSTI; NTIS.

The report deals with a terrestrial monitoring programme in Norway. Within the programme, the Norwegian Institute for Air Research (NILU) performed precipitation sampling and chemical analysis in seven experimental fields in 1993. Weekly precipitation samples are analyzed for all main ions, and monthly samples for different trace elements. The highest depositions of sulphur- and nitrogen-components were, as normally, largest during the winter and fall season. The total depositions are air pollutants in 1993 were due to small precipitation amounts in Southern Norway, the lowest observed since NILU started precipitation analysis early in the seventies. In the central and northern part of Norway the depositions were at the same level as in the two previous years. Also the levels of lead, copper and zinc in precipitation are significantly higher in southern Norway than in the central part of Norway. The monthly mean concentrations of Ni, As, Co, Cr and Fe are mostly measured to be below the detection levels at all sites. 7 figs., 4 tabs.

22321 (NREL/TP–430-7973) **Effect of leachate recirculation on landfill gas production and leachate quality: A controlled laboratory study.** Bogner, J.; Spokas, K. National Renewable Energy Lab., Golden, CO (United States). May 1995. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009215. Source: OSTI; NTIS; GPO Dep.

This report summarizes the results of a laboratory study conducted during 1992-1994 at Argonne National Laboratory. The study examined biogas production and leachate chemistry in parallel anaerobic assays run under either leachate recycle or leachate drainage regimes over a period of 400 days. A standardized synthetic refuse (paper, grass, food) was used in an experimental design which evaluated two elevated moisture contents and two added soils. All assays were conducted in vitro in 125 mL serum bottles. Four recycle/drainage events were completed during the 400 days of this experiment. Sufficient replicates (10 or 20) for each trial were included in the experimental design to permit destructive sampling of assay solids after each recycle/drainage event. Changes in the chemistry of solid, liquid, and gaseous phases were evaluated during the decomposition process. Analyses included major gases (CH_4, CO_2, O_2, N_2), selected chemical constituents of leachate (C1-C5 carboxylic acids, total organic carbon, Kjeldahl nitrogen, total phosphorus, iron, zinc, and chloride), leachate pH and conductivity, and selected solids analysis (gravimetric moisture content, volatile solids, total carbon, cellulose, hemicellulose, and lignin).

22322 (ORNL/CDIAC–79) **Continental scale estimates of the biotic carbon flux from land cover change: 1850 to 1980.** Daniels, R.C. (ed.) (Oak Ridge National Lab., TN (United States)); Houghton, R.A.; Hackler, J.L. Oak Ridge National Lab., TN (United States). Mar 1995. 145p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (NDP–050). Order Number DE95012262. Source: OSTI; NTIS; GPO Dep.

Environmental Sciences Division Publication No. 4379.

This document describes a Numeric Data Package (NDP) that contains annual carbon flux estimates from land cover change for nine regions of the world (i.e., North America, Europe, the Former Soviet Union, Pacific Developed Region, China, South and Central America, North Africa-Middle East, Tropical Africa, and South and Southeast Asia). Annual rates of land cover change and vegetation-soil response curves for each region and ecosystem are included in the database. The vegetation-soil curves are used in a bookkeeping carbon model to estimate the carbon flux with the atmosphere from the clearing or degradation of vegetation, cultivation of soils, decay of dead vegetation, and the recovery of abandoned lands. The model calculates the net flux of carbon in each region based on land cover change rates and vegetation-soil response curves for the period 1850 to 1980 (a few regions have WA cover records beginning in 1700 and carbon flux estimates ending in 1990). These data were collected and modeled in an attempt to reduce the uncertainty associated with the magnitude and time course of the flux of carbon from terrestrial vegetation to the atmosphere.

22323 (PNL–9224) **Initial field test of High-Energy Corona process for treating a contaminated soil-offgas stream.** Shah, R.R.; Garcia, R.E.; Jeffs, J.T.; Virden, J.W.; Heath, W.O. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010721. Source: OSTI; NTIS; INIS; GPO Dep.

The High-Energy Corona (HEC) technology for treating process offgases has been under development at Pacific Northwest Laboratory (PNL) since 1991. The HEC process uses high-voltage electrical discharges in air to ionize the air, forming a low-temperature plasma that would be expected to destroy a wide variety of organic compounds in air. The plasma contains strong oxidants, possibly including hydroxyl radicals, hydroperoxy radicals, superoxide radicals, various excited as well as ionized forms of oxygen, high-energy electrons, and ultraviolet (UV) light. Because the high-voltage plasma is produced near ambient temperatures and pressures, yet exhibits extremely rapid destruction kinetics with relatively low power requirements, the HEC technique appears promising as a low-cost treatment technique (Virden et al. 1992). As part of the Volatile Organic Compound (VOC) Nonarid Integrated Demonstration (ID) at the DOE Savannah River Site, research activities were initiated in December 1991 to develop a prototype HEC process for a small-scale field demonstration to treat a soil-offgas stream contaminated with trichloroethylene (TCE) and perchloroethylene (PCE) at varying concentrations. Over an 18-month period, the HEC technology was developed on a fast track, through bench and pilot scales into a trailer-mounted system that was tested at the Nonarid ID. Other national laboratories, universities, and private companies have also participated at the Nonarid ID to demonstrate a number of conventional, emerging and innovative approaches for treating the same soil-offgas stream.

22324 (PNL–10534) **Uranium characterization at the St. Louis Airport Site.** Schilk, A.J. (Pacific Northwest Lab., Richland, WA (United States)); Hubbard, C.W.; Bowyer, T.W.; Reiman, R.T. Pacific Northwest Lab., Richland, WA (United States). May 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012232. Source: OSTI; NTIS; INIS; GPO Dep.

In support of the Department of Energy/Office of Technology Development's Expedited Site Characterization (ESC) project (coordinated by Ames Laboratory), the Pacific Northwest Laboratory demonstrated two complementary technologies at the St. Louis Airport (SLAP) site that have been designed and optimized for the rapid, in situ quantification of radionuclide contamination in surface soils. The sensors are optimized for the detection of high-energy beta particles or gamma rays emitted from the decay of specific radionuclides of interest. These technologies were demonstrated by measuring the beta and gamma fluxes at several locations within the SLAP site. Measurements were converted to average contamination levels, using detector calibrations performed with spiked samples (beta) or sealed sources (gamma). Additionally, subsurface activity levels were derived from discrete soil samples (provided by the ESC field crew) via gamma-ray spectrometry in a controlled laboratory setting. Since the beta and gamma sensor technologies are intrinsically sensitive to different types of radiation

and activity distributions (i.e., surface and shallow subsurface, respectively), the data obtained from the two detectors provide complementary information about the distribution of the contamination. The results reported here suggest that a number of locations within the SLAP site have elevated levels of ^{211}U, and the differences between the beta and gamma activities indicate that the contamination is largely located near the surface of the soil.

22325 (PNL–10550) **Environmental settings for selected US Department of Energy installations - support information for the programmatic environmental impact statement and the baseline environmental management report.** Holdren, G.R.; Glantz, C.S.; Berg, L.K.; Delinger, K.; Fosmire, C.J.; Goodwin, S.M.; Rustad, J.R.; Schalla, R.; Schramke, J.A. Pacific Northwest Lab., Richland, WA (United States). May 1995. 458p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012478. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains the environmental setting information developed for 25 U.S. Department of Energy (DOE) installations in support of the DOE's Programmatic Environmental Impact Study (PEIS) and the Baseline Environmental Management Report (BEMR). The common objective of the PEIS and the BEMR is to provide the public with information about the environmental contamination problems associated with major DOE facilities across the country, and to assess the relative risks that radiological and hazardous contaminants pose to the public, onsite workers, and the environment. Environmental setting information consists of the site-specific data required to model (using the Multimedia Environmental Pollutant Assessment System) the atmospheric, groundwater, and surface water transport of contaminants within and near the boundaries of the installations. The environmental settings data describes the climate, atmospheric dispersion, hydrogeology, and surface water characteristics of the installations. The number of discrete environmental settings established for each installation was governed by two competing requirements: (1) the risks posed by contaminants released from numerous waste sites were to be modeled as accurately as possible, and (2) the modeling required for numerous release sites and a large number of contaminants had to be completed within the limits imposed by the PEIS and BEMR schedule. The final product is the result of attempts to balance these competing concerns in a way that minimizes the number of settings per installation in order to meet the project schedule while at the same, time providing adequate, if sometimes highly simplified, representations of the different areas within an installation. Environmental settings were developed in conjunction with installation experts in the fields of meteorology, geology, hydrology, and geochemistry.

22326 (PNL–10552) **Wildlife studies on the Hanford site: 1994 Highlights report.** Cadwell, L.L. (ed.). Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012477. Source: OSTI; NTIS; INIS; GPO Dep.

The purposes of the project are to monitor and report trends in wildlife populations; conduct surveys to identify, record, and map populations of threatened, endangered, and sensitive plant and animal species; and cooperate with Washington State and federal and private agencies to help ensure the protection afforded by law to native species and their habitats. Census data and results of surveys and special study topics are shared freely among cooperating agencies. Special studies are also conducted as needed to provide additional information that may be required to assess, protect, or manage wildlife resources at Hanford. This report describes highlights of wildlife studies on the Site in 1994. Redd counts of fall chinook salmon in the Hanford Reach suggest that harvest restrictions directed at protecting Snake River salmon may have helped Columbia River stocks as well. The 1994 count (5619) was nearly double that of 1993 and about 63% of the 1989 high of approximately 9000. A habitat map showing major vegetation and land use cover types for the Hanford Site was completed in 1993. During 1994, stochastic simulation was used to estimate shrub characteristics (height, density, and canopy cover) across the previously mapped Hanford landscape. The information provided will be available for use in determining habitat quality for sensitive wildlife species. Mapping Site locations of plant species of concern continued during 1994. Additional sensitive plant species data from surveys conducted by TNC were archived. The 10 nesting pairs of ferruginous hawks that used the Hanford Site in 1993 represented approximately 25% of the Washington State population.

22327 (PNL-SA–25951) **Heterogeneous surface fluxes and their effects on the SGP CART site.** Doran, J.C. (Pacific Northwest Lab., Richland, WA (United States)); Hu, Q.; Hubbe, J.M.; Liljegren, J.C.; Shaw, W.J.; Zhong, S.; Collatz, G.J. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9503140–2: 5. atmospheric radiation measurement (ARM) meeting, San Diego, CA (United States), 20-23 Mar 1995). Order Number DE95011495. Source: OSTI; NTIS; INIS; GPO Dep.

The treatment of subgrid-scale variations of surface properties and the resultant spatial variations of sensible and latent heat fluxes has received increasing attention in recent years. Mesoscale numerical simulations of highly idealized conditions, in which strong flux contrasts exist between adjacent surfaces, have shown that under some circumstances the secondary circulations induced by land-use differences can significantly affect the properties of the planetary boundary layer (PBL) and the region of the atmosphere above the PBL. At the Southern Great Plains (SGP) Cloud and Radiation Testbed (CART) site, the fluxes from different land-surface types are not expected to differ as dramatically as those found in idealized simulations. Although the corresponding effects on the atmosphere should thus be less dramatic, they are still potentially important. From an ARM perspective, in tests of single column models (SCMs) it would be useful to understand the effects of the lower boundary conditions on model performance. We describe here our initial efforts to characterize the variable surface fluxes over the CART site and to assess their effects on the PBL that are important for the performance of SCMs.

22328 (SAND–94-2418C) **The environmental assessment of nuclear materials disposition options: A transportation perspective.** Wilson, R.K.; Clauss, D.B.; Moyer, J.W. Sandia National Labs., Albuquerque, NM (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950936–1: Special meeting on the peaceful disposition of weapons-grade nuclear materials, Berlin (Germany), 3-9 Sep 1995). Order Number DE95011886. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy has undertaken a program to evaluate and select options for the long-term storage and disposition of fissile materials declared surplus to defense needs as a result of the end of the Cold War. The transport of surplus fissile material will be an important and highly visible aspect of the environmental impact studies and other planning documents required for implementation of the disposition options. This report defines the roles and requirements for transportation of fissile materials in the program, and discusses an existing methodology for determining the environmental impact in terms of risk. While it will be some time before specific alternatives are chosen that will permit the completion of detailed risk calculations, the analytical models for performing the probabilistic risk assessments already exist with much of the supporting data related to the transportation system. This report summarizes the various types of data required and identifies sources for that data.

22329 (SAND–95-1007C) **An up-scaled, buoyant invasion percolation model for use in delineating subsurface DNAPL location.** Glass, R.J.; Webb, E.K.; Conrad, S.H. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950828–10: National heat transfer conference, Portland, OR (United States), 5-9 Aug 1995). Order Number DE95012528. Source: OSTI; NTIS; GPO Dep.

We introduce an up-scaled, buoyant invasion percolation model (UIP) for application to non-wetting, dense, non-aqueous phase liquid (DNAPL) migration at the geologic formation scale within the saturated zone of an aquifer. The UIP model incorporates a gravitational potential to model the displacement of fluids of different

densities and can be used for either LNAPLs (lighter than water) or DNAPLs (denser than water). We demonstrate model behavior in a simulated braided stream deposit. Simulations show the influence of textural changes across layers and gravity forces in controlling DNAPL migration. While our results are encouraging, the application of this up-scaled percolation model requires a series of tests both in the laboratory and in the field before judgment of sufficient validity for its intended purpose is achieved.

22330 (SFIM-AEC-ET-CR–95013) **Uptake of explosives from contaminated soil by existing vegetation at the Iowa Army Ammunition Plant.** Schneider, J.F. (Argonne National Lab., IL (United States)); Zellmer, S.D.; Tomczyk, N.A.; Rastorier, J.R.; Chen, D.; Banwart, W.L. Argonne National Lab., IL (United States); Army Environmental Center, Aberdeen Proving Ground, MD (United States). Feb 1995. 33p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31-109-ENG-38. U.S.Army Environmental Center. Order Number DE95012998. Source: OSTI; NTIS; GPO Dep.

This study examines the uptake of explosives by existing vegetation growing in soils contaminated with 2,4,6-trinitrotoluene (TNT) and 1,3,5-trinitro-3,5-triazine (RDX) in three areas at the Iowa Army Ammunition Plant (IAAP). To determine explosives uptake under natural environmental conditions, existing plant materials and soil from the root zone were sampled at different locations in each area, and plant materials were separated by species. Standard methods were used to determine the concentrations of explosives, their derivatives, and metabolites in the soil samples. Plant materials were also analyzed. The compound TNT was not detected in the aboveground portion of plants, and vegetation growing on TNT-contaminated soils is not considered a health hazard. However, soil and plant roots may contain TNT degradation products that may be toxic; hence, their consumption is not advised. The compound RDX was found in the tops and roots of plants growing on RDX-contaminated soils at all surveyed sites. Although RDX is not a listed carcinogen, several of its potentially present degradation products are carcinogens. Therefore, the consumption of any plant tissues growing on RDX-contaminated sites should be considered a potential health hazard.

22331 (SLU-VNL-R–194) **Nitrogen flow in different cultivation systems. A field experiment at Lanna Research Station in south-west Sweden.** Haak, E.; Linden, B.; Persson, P.J. Swedish Univ. of Agricultural Sciences, Uppsala (Sweden). Dept. of Soil Sciences. 1994. 23p. (In Swedish). Order Number DE95779296. Source: OSTI; NTIS.

A long-term field experiment was started in 1979 at Lanna field experimental station, Skaraborg county, western Sweden, in order to study effects of crop rotation and nutrient management on the nitrogen flow in different cropping systems. The investigation comprised seven systems with two 6-year crop rotations, two with dairy farming, two with cash crops (one with high and one with low level of N-fertilization), one alternative/ecological, and two with spring barley mono cultures (one with application of pig slurry and mineral fertilizer-N and one with only mineral fertilizer-N). Each cropping system was connected to a separate drainage system, installed for collection and determination of the amounts of nitrate nitrogen leached with drainage water. Results are presented for two six-year crop rotations, 1979-84 and 1985-90, as regards crop and nitrogen yields and as regards nitrate-N losses by leaching. 12 refs, 7 tabs

22332 (UCRL-CR–119477) **Optimal groundwater remediation design: Methodologies and software for contaminated aquifers. Final report.** Dougherty, D.E. (Univ. of Vermont, Burlington, VT (United States). Research Center for Groundwater Remediation Design). Lawrence Livermore National Lab., CA (United States). 31 Oct 1994. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012476. Source: OSTI; NTIS; GPO Dep.

Report includes diskette designed to run on IBM PC or compatible equipment.

This document comprises the final report of work performed under sub-contract B-239648 between the Lawrence Livermore National Laboratory (LLNL) and the University of Vermont (UVM). This contract was subsidiary to one between LLNL and the U.S. Department of Energy (DOE). This project had the goal of developing tools and strategies regarding how and where and when to apply the environmental restoration (ER) technologies that are under development. The development of decision support software for advanced environmental remediation technologies is tentative; many of the ER technologies are poorly understood, the applicability of methods to new untested sites is questionable, the ability to predict the effects of alternative remediation designs is very limited, and there are a large number of uncertainties associated with processes and parameters (physical, chemical, and biological), contaminants (distribution and type), and sociopolitical environment. Nevertheless, the potential for significant savings by using optimal design methods and the need to make decisions regardless of uncertainties has made this project worthy. A stop-work order was received in September 1994. An additional upper limit of $15,000 was provided for project termination activities, including report preparation. One of four deliverables was completed and provided to LLNL. MODLP is a computational tool for use in groundwater remediation design. It is a FORTRAN program that incorporates the well known and widely used MODFLOW simulator to represent flow of water in a saturated natural porous medium. MODLP is designed to allow the user to create and solve optimization problems for hydraulic control in groundwater systems. Inasmuch as environmental restoration costs are very large, savings of on the order of ten percent represent significant amounts, and optimal design has been demonstrated to help produce savings larger than ten percent, these activities have an important role to play within DOE.

22333 (UCRL-ID–119659) **Lithogenic and cosmogenic tracers in catchment hydrology.** Nimz, G.J. Lawrence Livermore National Lab., CA (United States). Jan 1995. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011523. Source: OSTI; NTIS; INIS; GPO Dep.

A variety of physical processes affect solute concentrations within catchment waters. The isotopic compositions of the solutes can indicate which processes have determined the observed concentrations. These processes together constitute the physical history of the water, which is one of the primary concerns in hydrology. Many groundwater solutes are derived as a result of interaction between the water and the rock and/or soil within the system. These are termed "lithogenic" solutes. The isotopic compositions of these solutes provide information regarding rock-water interactions. Many other solutes have their isotopic compositions determined both internally and externally to the catchment system. Important members of this group include solutes that have isotopic compositions produced by atomic particle interactions with other nuclides. The source of the atomic particles can be cosmic radiation (producing "cosmogenic" nuclides in the atmosphere and land surface), anthropogenic nuclear reactions (producing "thermonuclear" nuclides), or radioactive and fission decay of naturally-occurring elements, such as U and Th (producing "in-situ" lithogenic nuclides in the deep subsurface). Current language usage often combines all of the atomic particle-produced nuclides under the heading "cosmogenic nuclides", and for simplicity we will often follow that usage, although always clearly indicating which variety is being discussed. This paper addresses the processes that affect the lithogenic and cosmogenic solute compositions in groundwater, and how these compositions can therefore be used in integrative ways to understand the physical history of groundwater within a catchment system.

22334 (UCRL-JC–119435) **Site characterization criteria (DOE-STD-1022-94) for natural phenomena hazards at DOE sites.** Chen, J.C.; Ueng, T.S.; Boissonnade, A.C. Lawrence Livermore National Lab., CA (United States). Dec 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950740–37: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95011743. Source: OSTI; NTIS; INIS; GPO Dep.

This paper briefly summarizes requirements of site characterization for Natural Phenomena Hazards (NPH) at DOE sites. In order to comply with DOE Order 5480.28, site characterization criteria has been developed to provide site-specific information needed for development of NPH assessment criteria. Appropriate approaches

are outlined to ensure that the current state-of-the-art methodologies and procedures are used in the site characterization. General and detailed site characterization requirements are provided in the areas of meteorology, hydrology, geology, seismology and geotechnical studies.

22335 (WSRC-RP-94-927) **Final Report on Testing of Off-Gas Treatment Technologies for Abatement of Atmospheric Emissions of Chlorinated Volatile Organic Compounds.** Jarosch, T.R.; Haselow, J.S.; Rossabi, J.; Burdick, S.A.; Raymond, R.; Young, J.E.; Lombard, K.H. Westinghouse Savannah River Co., Aiken, SC (United States). 23 Jan 1995. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060136. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to summarize the results of the program for off-gas treatment of atmospheric emissions of chlorinated volatile organic compounds (CVOCs), in particular trichloroethylene (TCE) and perchloroethylene (PCE). This program was funded through the Department of Energy Office of Technology Development's VOC's in Non-Arid Soils Integrated Demonstration (VNID). The off-gas treatment program was initiated after testing of in-situ air stripping with horizontal wells was completed (Looney et al., 1991). That successful test expectedly produced atmospheric emissions of CVOCs that were unabated. It was decided after that test that an off-gas treatment is an integral portion of remediation of CVOC contamination in groundwater and soil but also because several technologies were being developed across the United States to mitigate CVOC emissions. A single platform for testing off-gas treatment technologies would facilitate cost effective evaluation of the emerging technologies. Another motivation for the program is that many CVOCs will be regulated under the Clean Air Act Amendments of 1990 and are already regulated by many state regulatory programs. Additionally, compounds such as TCE and PCE are pervasive subsurface environmental contaminants, and, as a result, a small improvement in terms of abatement efficiency or cost will significantly reduce CVOC discharges to the environment as well as costs to United States government and industry.

22336 (WSRC-TR-92-355-Bk.1) **Hydrogeologic Setting of A/M Area: Framework for Groundwater Transport. Book 1.** Van Pelt, R.; Lewis, S.E.; Aadland, R.K. Westinghouse Savannah River Co., Aiken, SC (United States). 11 Mar 1994. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060117. Source: OSTI; NTIS; GPO Dep.

This document includes a brief summary of the regional geology within a 200-mile radius of the A/M Area, a summary of stratigraphy and hydrostratigraphic nomenclature as it applies to the A/M Area, and a summary of stratigraphy and hydrostratigraphy specific to the A/M Area. Five different stratigraphic cross sections show site-specific geology of the Tertiary section of the Upper Atlantic Coastal Plain geologic province within the A/M Area. The Cretaceous section lacks detail because the deepest wells penetrate only the uppermost part of the Upper Cretaceous sediments. Most of the wells are confined to the Tertiary section. The A/M Area is located in the northwestern corner of the Savannah River Site (SRS). The area serves as a main administrative hub for the site. Between 1958 and 1985, approximately 2,000,000 pounds of volatile organic solvents (metal degreasers, primarily trichloroethylene and tetrachloroethylene) were routed to the M Area Settling Basin. Between 1954 and 1958, effluent also was discharged to Tim's Branch via the A014 Outfall. In the main M Area Solvent Handling/Storage Area, a significant amount of leakage occurred from drums stored during this time period. Extensive quantities of solvents were transported, via the Process Sewer Line, to the M Area Settling Basin, and leaks occurred along this line as well. A smaller source area has been identified and is centered around the Savannah River Laboratory (SRL) (now called the Savannah River Technology Center [SRTC]) Complex. All of these source areas are represented by solvent contamination in the groundwater system. (Abstract Truncated)

22337 (WSRC-TR-92-355-Bk.6) **Hydrogeologic settings of A/M Area: Framework for groundwater transport: Book 6, Appendix B, Time/concentration graphs A/M Area monitoring wells.** Van Pelt, R.; Lewis, S.E.; Aadand, R.K. Westinghouse Savannah River Co., Aiken, SC (United States). 11 Mar 1994. 730p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95013964. Source: OSTI; NTIS; GPO Dep.

This document presents the time/concentration graphs for the Savannah River A/M monitoring wells. This Appendix B is part of the determination of the hydrogeologic setting of the A/M Area as a part of ground water transport studies.

22338 (WSRC-TR-94-0487-Vol.1) **F-Area Seepage Basins Groundwater Monitoring Report: Volume 1, Third and fourth quarters 1994.** Chase, J.A. Westinghouse Savannah River Co., Aiken, SC (United States). Mar 1994. 488p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060128. Source: OSTI; NTIS; INIS; GPO Dep.

Isoconcentration/isoactivity maps included in this report indicate both the concentration/activity and extent of the primary contaminants in each of the three hydrostratigraphic units. Geologic cross sections indicate both the extent and depth of contamination of the primary contaminants in all of the hydrostratigraphic units during the second half of 1994. Water-level maps indicate that the groundwater flow rates and directions at the F-Area Seepage Basins have remained relatively constant since the basins ceased to be active in 1988.

22339 (WSRC-TR-94-0488) **H-Area Seepage Basins Groundwater Monitoring Report: Volume 1, Third and Fourth quarters 1994.** Chase, J.A. Westinghouse Savannah River Co., Aiken, SC (United States). Mar 1994. 607p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060129. Source: OSTI; NTIS; INIS; GPO Dep.

22340 (WSRC-TR-95-0118) **TNX Area 1994 Annual Groundwater Monitoring Report.** Chase, J.A. Westinghouse Savannah River Co., Aiken, SC (United States). May 1995. 470p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060137. Source: OSTI; NTIS; INIS; GPO Dep.

During 1994, samples from selected wells of well cluster P 26 and the TBG, TNX, XSB, and YSB well series at the TNX Area were analyzed for selected heavy metals, indicator parameters, radionuclides, volatile organic compounds, and other constituents. Six parameters exceeded the final Primary Drinking Water Standards (PDWS). Nitrate and trichloroethylene exceeded the final PDWS most frequently. Five wells in this area currently are part of the Purge Water Containment Program due to high trichloroethylene concentrations. Carbon tetrachloride, gross alpha, nonvolatile beta, and tetrachloroethylene were elevated sporadically in one or more wells during the year. Groundwater flow directions and rates in the Unconfined Aquifer were similar from quarter to quarter during the year.

This report presents the details of a meeting of the American Society of Civil Engineers pertaining to water resources and quality. This report suggests an interdisciplinary approach to solving today's problems dealing with water resources.

22343 (DOE/BP/00029–1) **Evaluation of water quality conditions near proposed fish production sites associated with the Yakima Fisheries Project. Final report.** Dauble, D.d.; Mueller, R.P.; Martinson, G.A. Pacific Northwest Lab., Richland, WA (United States). May 1994. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI79-93BP00029. Order Number DE95011451. Source: OSTI; NTIS; INIS; GPO Dep.

In 1991, the Pacific Northwest Laboratory (PNL) began studying water quality at several sites in the Yakima River Basin for the Bonneville Power Administration. These sites were being proposed as locations for fish culture facilities as part of the Yakima Fisheries Project (YFP). Surface water quality parameters near the proposed fish culture facilities are currently suitable for fish production. Water quality conditions in the mainstream Yakima River and its tributaries are generally excellent in the upper part of the watershed (i.e., near Cle Elum), but they are only fair to poor for the river downstream of Union Gap (river mile 107). Water quality of the Naches River near Oak Flats is also suitable for fish production. Groundwater supplies near the proposed fish production facilities typically have elevated concentrations of metals and dissolved gases. These conditions can be mitigated using best engineering practices such as precipitation and degasification. Additionally, mixing with surface water may improve these conditions. Depending on the location and depth of the well, groundwater temperatures may be warmer than optimum for acclimating and holding juvenile and adult fish. Water quality parameters measured in the Yakima River and tributaries sometimes exceed the range of values described as acceptable for culture of salmonids and for the protection of other aquatic life. However, constituent concentrations are within ranges that exist in many northwest fish hatcheries. Additionally, site-specific tests conducted by PNL (i.e., live box exposures and egg incubation studies) indicate that fish can be successfully reared in surface and well water near the proposed facility sites. Thus, there appear to be no constraints to artificial production for the YFP.

22344 (DOE/EA–1075) **Proposed Casey's Pond Improvement Project, Fermi National Accelerator Laboratory.** Department of Energy, Washington, DC (United States). Div. of Electric Energy Systems. May 1995. 56p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95013827. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) has prepared an Environmental Assessment (EA), evaluating the impacts associated with the proposed Casey's Pond Improvement Project at the Fermi National Accelerator Laboratory (Fermilab) in Batavia, Illinois. The improvement project would maximize the efficiency of the Fermilab Industrial Cooling Water (ICW) distribution system, which removes (via evaporation) the thermal load from experimental and other support equipment supporting the high energy physics program at Fermilab. The project would eliminate the risk of overheating during fixed target experiments, ensure that the Illinois Water Quality Standards are consistently achieved and provide needed additional water storage for fire protection. Based on the analysis in the EA, the DOE has determined that the proposed action does not constitute a major Federal action significantly affecting the quality of the human environment, within the meaning of the National Environmental Policy Act (NEPA) of 1969. Therefore, the preparation of an Environmental Impact Statement is not required.

22345 (ETDE-DE–120) **Development of process combinations facilitating the commercial use of powdered active carbon in refined waste water purification through recycling of biologically regenerated, partially loaded active carbon. Final report.** Rott, U.; Menzel, U.; Detter, A. Stuttgart Univ. (Germany). Inst. fuer Siedlungswasserbau, Wasserguete- und Abfallwirtschaft. 15 Feb 1995. 177p. (In German). Sponsored by Bundesministerium fuer Bildung, Wissenschaft, Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMBF 02WA9107. Order Number DE95785544. Source: OSTI; NTIS (US Sales Only).

Processes for refined waste water purification combining adsorption, flocculation, and filtration can be optimised with regard to filter service life, filter charge rate and output quality by adding a sedimentation stage upstream the filter to enhance the deposition of active carbon. The overall result of solids deposition turns out to be better if the flocculation agents are added prior to sedimentation rather than after. Recirculating the partially loaded powdered active carbon in the biological section of the plant improves the output of the biological stage with regards to the parameters dyes, AOX and COD. Moreover, this greatly improves the settling behaviour of the activated sludge. In two-stage plants this latter effect is found to be greater if the partially loaded powdered active carbon is returned to the first stage rather than to the second biological stage of the plant. Thus the consumption of fresh powdered active carbon is reduced without affecting final output quality. (orig.)

Due to permanent nitrate pollution of many agriculturally influenced groundwaters there is an urgent need of comparable data and facts about the development of nitrate contents under forests in order to manage drinking water resources. Evaluation for Bavaria

is based on new data from literature and own measurements of nitrogen deposition as well as concentration of nitrates in the deeper seepage zone, and at ground water catchment measuring points. These data show a mean nitrate concentration in the ground water of 10.5 mg/l which is wholly attributable to the influence of the forest. At individual sites mean concentrations were found to range from trace contents to between 20-30mg/l. With some exceptions, pollution levels are not alarming so far. With ongoing deposition of nitrogen, however, we have to expect increased nitrate concents in groundwater under forests. The nitrate problem may therefore considerably aggravate drinking water supply. (orig./EW).

22348 (GSF–39/93, pp. 333-343) **Factors influencing carry-over and carry-out of nitrogen in forest ecosystems, selected examples from sites in the Spessart, Fichtelgebirge and Munich gravel plains.** Krebs, M. Case studies from the development project "Effects of acid rain and forest death on groundwater" were the basis of a discussion of the following factors influencing carry-over and carry-out of nitrogen in forest eco systems: 1. Comparison of nitrogen flow with water in a young spruce stand and one old spruce stand at sites in the Munich gravel plain and in the Fichtelgebirge showed that the lower rate of deposition and the higher nitrogen demand in young forests usually lead to lower nitrate pollution levels in the groundwater. Growing forest undergrowth in old stands and general nitrogen storage capacitities of the soil are both modifying factors. Contrary to the health young trees in the Munich gravel plains the young trees in the Fichtelgebirge show already clear evidence of nitrogen carry-out into seepage waters. The reason appears to lie in the high quantities of acid carried into the Fichtelgebirge which further degrade the naturally acid soils and damaged the trees. 2. After stormthrow events in the spruce stands in the Spessart and the Munich gravel plains there was first a rise of nitrate concentrations in seepage water which, after peaking in the first winter, slowly decreased over the years. Seasonal levels of nitrate contents is traced back to the influence of nitrogen absorption by soil vegetation and trees growing at the side of the stand during the vegetation period. (orig./EW).

22349 (INIS-mf–14543) **Studies applications through tracers techniques and effluent contaminants dispersing in Montevideo coastal waters and east beaches.** Suarez, R. (Direccion Nacional de Tecnologia Nuclear, Montevideo (Uruguay)); Dellepere, A.; Pintos, A.; Barreiro, M.; Odino, R.; Souto, B.; Badano, A.; Crosignani, L.; Moreno, S. Ministerio de Industria, Energia y Mineria, Montevideo (Uruguay). Direccion Nacional de Tecnologia Nuclear; Universidad de la Republica, Montevideo (Uruguay). Facultad de Ingenieria. [1995]. 16p. (In Spanish). Order Number DE95631062. Source: OSTI; NTIS (US Sales Only); INIS.

With the purpose to define or not the contamination influence in Montevideo coastal waters, uranine and tritium tracers were injected in outlet river. A higher grade of contamination was found in the Montevideo Bay, and several recommendations were given for the future.

22350 (INIS-PE–95-02) **Origin of the water drained by the tunnel Graton.** Plata B, A. (International Atomic Energy Agency, Vienna (Austria). Dept. of Research and Isotopes); Rojas M, R. Instituto Peruano de Energia Nuclear, Lima (Peru). Dec 1992. 20p. (In Spanish). Order Number DE95632317. Source: OSTI; NTIS (US Sales Only); INIS.

The research of the origin of the water drained by the Graton tunnel was attempted using isotope techniques. During the period of studies (April 1989-October 1992), four field work was executed to sample waters for chemistry, stable isotope and Tritium analysis, an to inject tracers and verify the possible infiltration from the Rimac and Blanco rivers to the tunnel. The results of the stable isotope analysis show that the water drained by the Graton tunnel comes from a basin around 300 meters above the average altitude of the basin where the Graton is located. The Tritium analysis show that the water is relatively modern. Using the model of total mixing, the residence times of the water drained at the km 0.5 and 2.5 are in the order to 45 years. The conductivities of the water of the tunnel is higher than the Rimac river ones because the influence of mine water. The chemical analysis of the water sampled at the downstream end of the tunnel, show that the conservative ions of the water kept almost constant during more than two years. The results of the work with artificial tracer show that there is no significant leakage from the Rimac and Blanco rivers to the Graton tunnel. So far, it can be concluded as a preliminary approach that the Graton tunnel drains relatively modern water originated in another basin. The hydrodynamics of the area of study seems to include a large storage on underground water in the system. The topography, geology and isotopic composition of the water samples, points to the upper Mantaro river basin as the possible source of part of the water drained by the Graton tunnel. 22351 (ORNL/ER–206/V1) **Final project report on arsenic biogeochemistry in the Clinch River and Watts Bar Reservoir: Volume 1, Main text. Environmental Restoration Program.** Ford, C.J.; Byrd, J.T.; Grebmeier, J.M.; Harris, R.A.; Moore, R.C.; Madix, S.E.; Newman, K.A.; Rash, C.D. Oak Ridge National Lab., TN (United States). Apr 1995. 102p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012537. Source: OSTI; NTIS; GPO Dep.

This document reports on the study of arsenic contamination in the Clinch River/Watts Bar Reservoir (CR/WBR) system, downstream from the US Department of Energy's Oak Ridge Reservation (ORR). Arsenic is of particular interest and concern because it occurs commonly in coal-bearing rock and waste products, such as fly ash associated with the burning of coal; it is classified as a Class A carcinogen by the Environmental Protection Agency; and disposal of fly ash, both on and off the ORR, may have contaminated surface water and sediments in the Clinch River and Watts Bar Reservoir. Four main sites were sampled quarterly over a 3-year period. Sites investigated included lower Watts Bar Reservoir near Watts Bar Dam [Tennessee River kilometer (TRK) 849.6], the Kingston area [Clinch River kilometer (CRK) 1.6], Poplar Creek, and the McCoy Branch Embayment. Additional sites were investigated in the vicinity of these main stations to determine the distribution of contamination and to identify possible alternative or additional sources of arsenic.

22352 (SFIM-AEC-ET-CR–95014) **Plant uptake of explosives from contaminated soil at the Joliet Army Ammunition Plant.** Zellmer, S.D. (Argonne National Lab., IL (United States)); Schneider, J.F.; Tomczyk, N.A.; Banwart, W.L.; Chen, D. Argonne National Lab., IL (United States). Apr 1995. 66p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95011642. Source: OSTI; NTIS; GPO Dep.

Explosives and their degradation products may enter the animal and human food chains through plants grown on soils contaminated with explosives. Soil and plant samples were collected from the Group 61 area at the Joliet Army Ammunition Plant and analyzed to determine the extent to which 2,4,6-trinitrotoluene (TNT) and its degradation products are taken up by existing vegetation and crops growing on contaminated soils. Neither TNT nor its degradation products was detected in any of the aboveground plant organs of existing vegetation. Oat (Avena sativa L.) and perennial ryegrass (Lolium perenne L.) were planted on TNT-contaminated soils amended with three levels of chopped grass hay. Extractable TNT concentrations in hay-amended soils were monitored for almost 1 year. Crop establishment and growth improved with increased levels of hay amendment, but TNT uptake was not affected or detected in any aboveground crop organs. Evidence was found to indicate that soil manipulation and hay addition

may reduce extractable TNT concentration in soils, but the wide variations in TNT concentrations in these soils prevented development of conclusive evidence regarding reduction of extractable TNT concentrations. Results from this study suggest that vegetation grown on TNT-contaminated soils is not a major health concern because TNT and its degradation products were not detected in aboveground plant organs. However, low concentrations of TNT, 4-amino-2,6-dinitrotoluene, and 2-amino-4,6-dinitrotoluene were detected in or on some existing vegetation and crop roots. 21 refs., 10 figs., 26 tabs.

22353 (UCRL-JC--118909) **Cost-effective sampling of ground water monitoring wells.** Johnson, V.M. (Lawrence Livermore National Lab., CA (United States)); Ridley, M.N.; Tuckfield, R.C. Lawrence Livermore National Lab., CA (United States). Feb 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9504134--6: HAZMACON '95: hazardous materials management conference and exhibition, San Jose, CA (United States), 4-6 Apr 1995). Order Number DE95012222. Source: OSTI; NTIS; GPO Dep.

Cost-Effective Sampling (CES) is a method for estimating the lowest-frequency (and, as a result, lowest-cost) sampling schedule for a given groundwater monitoring location which will still provide needed information for regulatory and remedial decision-making. Its initial development was motivated by the preponderance of sampling results showing little changes over time or failing below detection limits at Lawrence Livermore National Laboratory's (LLNL's) environmental restoration sites. The fact that many locations had never shown, or had ceased for some time to show, any detectable levels or changes in levels of contamination suggested that some of their 700+ groundwater monitoring wells were being sampled more often than necessary. Similar concerns were raised at the Savannah River Site (SRS), where some 10,000 samples are taken per year from 1500+ monitoring wells. The question facing both organizations has been how to reduce sampling costs while still satisfying both regulatory agencies and their own scientists and engineers that sufficient data will be collected for decision-making purposes. The first version of CES was implemented at LLNL's Livermore site in 1992 and approved by regulators under CERCLA. It is designed to statistically evaluate the sampling results to be able to recommend sampling schedules of groundwater monitoring locations for a common suite of volatile organic compounds, with the goal of reducing frequencies. The table below presents the sampling status of monitoring wells at LLNL's two restoration sites both before and after the application of CES.

22354 (VTT-PUB--208) **On-line measurement of oil contaminants in water by filter-based infrared analyzers.** Niemelae, P. (VTT Electronics, Oulu (Finland). Optoelectronics). Technical Research Centre of Finland, Espoo (Finland); Oulu Univ. (Finland). 1994. 116p. Order Number DE95779234. Source: OSTI; NTIS; INIS.

The properties of a dedicated infrared analyzer for on-line measurement of the oil content of water, the Oili analyzer, are evaluated theoretically and with laboratory measurements. The analyzer was originally developed for controlling the discharge of ballast and bilge water from oil tankers and more than 200 such instruments have now been supplied for that purpose, representing about 10 % of the total market. Some technical improvements are suggested, and the improved instrument is shown to be capable of measuring oil in water to an accuracy of +- 20 % down to a detection limit of +5-10 ppm in the presence of high concentrations of interfering components and under varying environmental conditions. This opens up new potential applications for the instrument, e.g. the monitoring of water discharges from oil and gas production platforms. The infrared analyzer responds only to the dispersed oil fraction, and if the dissolved fraction is of interest as well, the instrument must be equipped with a UV option, as suggested here.

22355 (WHC-SD-ER5480-ER--001-Rev.1) **Hanford facilities tracer study report (315 Water Treatment Facility). Revision 1.** Ambalam, T. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); ICF Kaiser Hanford Co., Richland, WA (United States). May 1995. 96p. Sponsored by USDOE, Washington, DC (United States). Inferring phylogenetic trees is a fundamental problem in computational-biology. We present a new objective criterion, the phylogenetic number, for evaluating evolutionary trees for species defined by biomolecular sequences or other qualitative characters. The phylogenetic number of a tree T is the maximum number of times that any given character state arises in T. By contrast, the classical parsimony criterion measures the total number of times that different character states arise in T. We consider the following related problems: finding the tree with minimum phylogenetic number, and computing the phylogenetic number of a given topology in which only the leaves are labeled by species. When the number of states is bounded (as is the case for biomolecular sequence characters), we can solve the second problem in polynomial time. We can also compute a fixed-topology 2-phylogeny (when one exists) for an arbitrary number of states. This algorithm can be used to further distinguish trees that are equal under parsimony. We also consider a number of other related problems.

22358 (CONF-9505220--1) **Drosophila GRAIL: An intelligent system for gene recognition in Drosophila DNA sequences.** Xu, Ying (Oak Ridge National Lab., TN (United States)); Einstein, J.R.; Uberbacher, E.C.; Helt, G.; Rubin, G. Oak Ridge National Lab., TN (United States); California Univ., Berkeley, CA (United States). Dept. of Molecular and Cell Biology. [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1. international Institute of Electrical and Electronic Engineers (IEEE) symposium on intelligence in neural and biological systems; Hendron, VA (United States); 23-25 May 1995. Order Number DE95013042. Source: OSTI; NTIS; GPO Dep.

An AI-based system for gene recognition in Drosophila DNA sequences was designed and implemented. The system consists of two main modules, one for coding exon recognition and one for

single gene model construction. The exon recognition module finds a coding exon by recognition of its splice junctions (or translation start) and coding potential. The core of this module is a set of neural networks which evaluate an exon candidate for the possibility of being a true coding exon using the "recognized" splice junction (or translation start) and coding signals. The recognition process consists of four steps: generation of an exon candidate pool, elimination of improbable candidates using heuristic rules, candidate evaluation by trained neural networks, and candidate cluster resolution and final exon prediction. The gene model construction module takes as input the clustered exon candidates and builds a "best" possible single gene model using an efficient dynamic programming algorithm. 129 Drosophila sequences consisting of 441 coding exons including 216358 coding bases were extructed from GenBank and used to build statistical matrices and to train the neural networks. On this training set the system recognized 97% of the coding messages and predicted only 5% false messages. Among the "correctly" predicted exons, 68% match the actual exon exactly and 96% have at least one edge predicted correctly. On an independent test set consisting of 30 Drosophila sequences, the system recognized 96% of the coding messages and predicted 7% false messages.

22359 (DOE/ER/14003–6) **Energetics and kinetics of anaerobic aromatic and fatty acid degradation. Progress report, November 1993–November 1994.** McInerney, M.J. Oklahoma Univ., Norman, OK (United States). Dept. of Botany and Microbiology. 6 Dec 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-89ER14003. Order Number DE95013068. Factors influencing the rate and extent of benzoate degradation by the anaerobic syntrophic consortia were studied. Nonlinear regression analysis showed that the cause of the benzoate threshold was not a diminished benzoate degradation capacity. Analysis of cocultures with hydrogen users that differed in their hydrogen utilization capacities showed that the threshold did not depend on the kinetic properties of the syntrophic partner. These data support a thermodynamic explanation for the threshold, and exclude the possibility that a change in the affinity of the enzyme system due to acetate inhibition caused the threshold. Modeling studies showed that the threshold value could be predicted from the concentrations of the end products, assuming a critical Gibb's free energy value. This work shows that interspecies acetate transfer is important in controlling the extent of metabolism by syntrophic organisms.

22360 (LBL–36921) **Structural studies of bacterial transcriptional regulatory proteins by multidimensional heteronuclear NMR.** Volkman, B.F. California Univ., Berkeley, CA (United States). Dept. of Chemistry; Lawrence Berkeley Lab., CA (United States). Feb 1995. 195p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95011259. Source: OSTI; NTIS; GPO Dep.

Nuclear magnetic resonance spectroscopy was used to elucidate detailed structural information for peptide and protein molecules. A small peptide was designed and synthesized, and its three-dimensional structure was calculated using distance information derived from two-dimensional NMR measurements. The peptide was used to induce antibodies in mice, and the cross-reactivity of the antibodies with a related protein was analyzed with enzyme-linked immunosorbent assays. Two proteins which are involved in regulation of transcription in bacteria were also studied. The ferric uptake regulation (Fur) protein is a metal-dependent repressor which controls iron uptake in bacteria. Two- and three-dimensional NMR techniques, coupled with uniform and selective isotope labeling allowed the nearly complete assignment of the resonances of the metal-binding domain of the Fur protein. NTRC is a transcriptional enhancer binding protein whose N-terminal domain is a 'receiver domain' in the family of 'two-component' regulatory systems. Phosphorylation of the N-terminal domain of NTRC activates the initiation of transcription of aeries encoding proteins involved in nitrogen regulation. Three- and four-dimensional NMR spectroscopy methods have been used to complete the resonance assignments and determine the solution structure of the N-terminal receiver domain of the NTRC protein. Comparison of the solution structure of the NTRC receiver domain with the crystal structures of the homologous protein CheY reveals a very similar fold, with the only significant difference being the position of helix 4 relative to the rest of the protein. The determination of the structure of the NTRC receiver domain is the first step toward understanding a mechanism of signal transduction which is common to many bacterial regulatory systems.

22361 (ORNL/TM–12976) **Alignment of DNA and protein sequences containing frameshift errors.** Guan, X.; Uberbacher, E.C. Oak Ridge National Lab., TN (United States). Apr 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95010432. Source: OSTI; NTIS; GPO Dep.

Molecular sequences, like all experimental data, are subject to error. Many current DNA sequencing protocols have very significant error rates and often generate artifactual insertions and deletions of bases (indels) which corrupt the translation of sequences and compromise the detection of protein homologies. The impact of these errors on the utility of molecular sequence data is dependent on the analytic technique used to interpret the data. In the presence of frameshift errors, standard algorithms using six frame translation can miss important homologies because only sub-fragments of the correct translation are available in any given frame. We present a new algorithm which can detect and correct frameshift errors in DNA sequences during comparison of translated sequences with protein sequences in the databases. This algorithm can recognize homologous proteins sharing 30% identity even in the presence of a 7% frameshift error rate. Our algorithm uses dynamic programming, producing a guaranteed optimal alignment in the presence of frameshifts, and has a sensitivity equivalent to Smith-Waterman. The computational efficiency of the algorithm is O(nm) where n and m are the sizes of two sequences being compared. The algorithm does not rely on prior knowledge or heuristic rules and performs significantly better than any previously reported method.

22362 (UCRL-JC–120812) **A MEMS-based miniature DNA analysis system.** Northrup, M.A. (and others); Gonzalez, C.; Hadley, D. Lawrence Livermore National Lab., CA (United States). 25 Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9506192–1: Transducers '95, Stockholm (Sweden), 25-29 Jun 1995). Order Number DE95013266. Source: OSTI; NTIS; GPO Dep.

We detail the design and development of a miniature thermal cycling instrument for performing the polymerase chain reaction (PCR) that uses microfabricated, silicon-based reaction chambers. The MEMS-based, battery-operated instrument shows significant improvements over commercial thermal cycling instrumentation. Several different biological systems have been amplified and verified with the miniature PCR instrument including the Human Immunodeficiency Virus; both cloned and genomic DNA templates of β globin; and the genetic disease, Cystic Fibrosis from human DNA. The miniaturization of a PCR thermal cycler is the initial module of a fully-integrated portable, low-power, rapid, and highly efficient bioanalytical instrument.

Office of NEPA Oversight. Dec 1994. 66p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012235. Source: OSTI; NTIS; GPO Dep.

Lawrence Berkeley Laboratory (LBL) proposes to construct and operate a new laboratory for consolidation of current and future activities of the Human Genome Center (HGC). This document addresses the potential direct, indirect, and cumulative environmental

and human-health effects from the proposed facility construction and operation. This document was prepared in accordance the National Environmental Policy Act of 1969 (United States Codes 42 USC 4321-4347) (NEPA) and the US Department of Energy's (DOE) Final Rule for NEPA Implementing Procedures [Code of Federal Regulations 10CFR 1021].

22364 (DOE/ER/61780–1) **Minitrack on data and knowledge base issues in genomics at the 27th Hawaii International Conference on system sciences.** Connecticut Univ., Storrs, CT (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-94ER61780. (CONF-940136–Summ.: 27. Hawaii international conference on system sciences, Maui, HI (United States), 4-7 Jan 1994). Order Number DE95011299. Source: OSTI; NTIS; GPO Dep.

This report is a summary of the proceedings from the Minitrack on Data and Knowledge Base Issues in Genomics at the 27th Hawaii International Conference on System Science, January 4 - 7, 1994. The minitrack was organized by Dong-Guk Shin (University of Connecticut) and Francois Rechenmann (INRIA, France). Support was jointly provided by the NSF, NIH and DOE. The minitrack included, after rigorous review, ten full papers and four extended abstracts in the following five different research subareas of genome informatics: data modeling and management, sequence analysis, graphical user interface, interoperation in a heterogenous computing environment, and system integration in a knowledge-based approach.

22366 (LA-UR–95-1325) **Monte Carlo investigations of elastic scattering spectroscopy applied to latex spheres used as tissue phantoms.** Boyer, J.; Mourant, J.R.; Bigio, I.J. Los Alamos National Lab., NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950226–44: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-14 Feb 1995). Order Number DE95012069. Source: OSTI; NTIS; GPO Dep.

An optical-fiber-coupled, elastic-scatter spectrometer has proven effective in discriminating between malignant and non-malignant tissue in the human bladder and gastrointestinal tract. The system injects broadband light into the tissue with an optical fiber and spectrally analyzes the returning light collected by an adjacent fiber. The collected photons have experienced multiple scattering events and therefore arrive at the analysis fiber after traveling varied paths.the diameter of the source fiber is comparable to its separation from the collection fiber. The diffusion model is inappropriate for this geometry; therefore, Monte Carlo simulations are used. In addition, the size of the scattering sites in tissue are expected to be of the same order as the excitation wavelengths, and Mie theory is expected to provide the best description of the scattering and extinction. The authors will present and compare the results of simulations and measurements of the elastic scatter signal for suspensions of latex spheres in hemoglobin solutions of varying concentrations.

22367 (LA-UR–95-1478) **Computational radiology and imaging with the MCNP Monte Carlo code.** Estes, G.P.; Taylor, W.M. Los Alamos National Lab., NM (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9404262–1: 1. world congress on computational medicine, public health and biotechnology, Austin, TX (United States), 24-28 Apr 1994). Order Number DE95011995. Source: OSTI; NTIS; GPO Dep.

MCNP, a 3D coupled neutron/photon/electron Monte Carlo radiation transport code, is currently used in medical applications such as cancer radiation treatment planning, interpretation of diagnostic radiation images, and treatment beam optimization. This paper will discuss MCNP's current uses and capabilities, as well as envisioned improvements that would further enhance MCNP role in computational medicine. It will be demonstrated that the methodology exists to simulate medical images (e.g. SPECT). Techniques will be discussed that would enable the construction of 3D computational geometry models of individual patients for use in patient-specific studies that would improve the quality of care for patients.

22368 (LBL–36616) **Three dimensional nuclear magnetic resonance spectroscopic imaging of sodium ions using stochastic excitation and oscillating gradients.** Frederick, B.deB. (California Univ., Berkeley, CA (United States)). Lawrence Berkeley Lab., CA (United States); California Univ., Berkeley, CA (United States). Dec 1994. 117p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95012354. Source: OSTI; NTIS; INIS; GPO Dep.

Nuclear magnetic resonance (NMR) spectroscopic imaging of ^{23}Na holds promise as a non-invasive method of mapping Na^+ distributions, and for differentiating pools of Na^+ ions in biological tissues. However, due to NMR relaxation properties of ^{23}Na in vivo, a large fraction of Na^+ is not visible with conventional NMR imaging methods. An alternate imaging method, based on stochastic excitation and oscillating gradients, has been developed which is well adapted to measuring nuclei with short T_2. Contemporary NMR imaging techniques have dead times of up to several hundred microseconds between excitation and sampling, comparable to the shortest in vivo ^{23}Na T_2 values, causing significant signal loss. An imaging strategy based on stochastic excitation has been developed which greatly reduces experiment dead time by reducing peak radiofrequency (RF) excitation power and using a novel RF circuit to speed probe recovery. Continuously oscillating gradients are used to eliminate transient eddy currents. Stochastic ^1H and ^{23}Na spectroscopic imaging experiments have been performed on a small animal system with dead times as low as 25μs, permitting spectroscopic imaging with 100% visibility in vivo. As an additional benefit, the encoding time for a 32x32x32 spectroscopic image is under 30 seconds. The development and analysis of stochastic NMR imaging has been hampered by limitations of the existing phase demodulation reconstruction technique. Three dimensional imaging was impractical due to reconstruction time, and design and analysis of proposed experiments was limited by the mathematical intractability of the reconstruction method. A new reconstruction method for stochastic NMR based on Fourier interpolation has been formulated combining the advantage of a several hundredfold reduction in reconstruction time with a straightforward mathematical form.

22369 (NEDO-IT–9210) **Material design related investigation. Investigation on the bionic design.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 158p. (In Japanese). Order Number DE95786810. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

The biomolecular characteristics were analyzed to establish the basic technology for the utilization of artificial joint, liver and muscle. The rise in functional grade of biomolecules themselves, and inter-biomolecular recognition and bonding rationally and teleologically generates living body's functions to form the structure and

drive the molecules. Energywise extremely advantageous, those functions serve to creatively produce the artificial internal organs and elucidate the function of biotissue, if the tissue and function of living body can be artificially restructured by utilizing the biomolecular mechanism to make the tissue self-proper. It is the concept of bionic desing research. Methodologically, the inter-bimolecular action is to be synthetically analyzed through bio/physicochemistry-based computer simulation. The artificial materials excelling in adaptability to the living body are to be developed by analyzing the mechanism for the biotissue. The molecules-driving function is also to be analyzed which is generated dy the high-grade bonding of muscular and other high biomolecules. 280 refs., 69 figs., 9 tabs.

22370 (NUREG–0940-Vol.14-No.1-Pt.2) **Enforcement actions: Significant actions resolved medical licensees. Quarterly progress report, January 1995–March 1995. Volume 14, No. 1, Part 2.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Enforcement. May 1995. 289p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This compilation summarizes significant enforcement actions that have been resolved during one quarterly period (January-March 1995) and includes copies of letters, Notices, and Orders sent by the Nuclear Regulatory Commission to medical licensees with respect to these enforcement actions. It is anticipated that the information in this publication will be widely disseminated to managers and employees engaged in activities licensed by the NRC, so that actions can be taken to improve safety by avoiding future violations similar to those described in this publication.

22371 (SAND–95-0747C) **An overview of weapons technologies used to improve US healthcare.** Fahrenholtz, J.; Kovarik, T.L. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506184–1: Society of Women Engineers national meeting, Boston, MA (United States), 27 Jun - 1 jul 1995). Order Number DE95011602. Source: OSTI; NTIS; INIS; GPO Dep.

At Sandia National Laboratories the Biomedical Engineering Program uses existing weapons-related technology in medical applications in order to reduce health care costs, improve diagnoses, and promote efficient health care delivery. This paper describes several projects which use Sandia technologies to solve biomedical problems. Specific technical capabilities that are important to this program include sensor data interpretation, robotics, lasers and optics, microelectronics, image processing and materials.

22372 (SAND–95-1123C) **Micro-telerobotic applications for microsurgery.** Ford, W.E. (Sandia National Labs., Albuquerque, NM (United States)); Morimoto, A.K.; Kozlowski, D.M.; Charles, S.T. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506178–2: International Association of Science and Technology for Development conference on robotics and manufacturing, Cancun (Mexico), 14-17 Jun 1995). Order Number DE95013018. Source: OSTI; NTIS; GPO Dep.

MicroDexterity Systems Inc. and Sandia National Laboratories are collaborating on the design of a six degree-of-freedom surgeon-controlled micropositioner and a six degree-of-freedom surgeon-controlled master for use in microsurgery. A control system will provide the linkage between the force-reflecting master and micropositioner for force scaling, position scaling, and tremor filtering. The technologies developed by this project are expected to enhance the skills of surgeons, improve the success rates for existing microsurgical procedures, make new high-dexterity procedures possible, and ultimately reduce surgical costs by increasing the precision and speed of operations. This paper discusses the motivation, approach, and accomplishments to date.

22373 (UCRL-JC–118744) **PEREGRINE: An all-particle Monte Carlo code for radiation therapy.** Hartmann Siantar, C.L.; Chandler, W.P.; Rathkopf, J.A.; Svatos, M.M.; White, R.M. Lawrence Livermore National Lab., CA (United States). Sep 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950420–24: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95012457. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of radiation therapy is to deliver a lethal dose to the tumor while minimizing the dose to normal tissues. To carry out this task, it is critical to calculate correctly the distribution of dose delivered. Monte Carlo transport methods have the potential to provide more accurate prediction of dose distributions than currently-used methods. PEREGRINE is a new Monte Carlo transport code developed at Lawrence Livermore National Laboratory for the specific purpose of modeling the effects of radiation therapy. PEREGRINE transports neutrons, photons, electrons, positrons, and heavy charged-particles, including protons, deuterons, tritons, helium-3, and alpha particles. This paper describes the PEREGRINE transport code and some preliminary results for clinically relevant materials and radiation sources.

22374 (UCRL-ID–116044) **Historical summary and recommendations on Melanoma in the LLNL workforce.** Moore, D.H. II; Hatch, F. Lawrence Livermore National Lab., CA (United States). Dec 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013288. Source: OSTI; NTIS; GPO Dep.

This document provides a historical summary and recommendations on melanoma in the Lawrence Livermore National Laboratory (LLNL) workforce. Melanoma of the skin comprises about 3.5% of the incidence (38,000 new cases in 1991) and 1.7% of the mortality (8500 deaths in 1991) of all cancer in the U.S. However, for several decades it has shown the fastest rate of increase of any cancer site. The following areas are discussed: background and recognition of increased melanoma at LLNL, history of melanoma studies at LLNL, results from occupational factors study, overall conclusion on increased melanoma incidence, and recommendations for future management.

22375 (UCRL-JC–119789) **Mathematical analysis of errors resulting from choice of reference frame coordinates in measuring human joint motion.** Hollerbach, K. (Lawrence Livermore National Lab., CA (United States)); Hollister, A. Lawrence Livermore National Lab., CA (United States). Feb 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9507124–1: 15. Congress of the International Society of Biomechanics, Jyvaskyla (Finland), 2-6 Jul 1995). Order Number DE95010918. Source: OSTI; NTIS; GPO Dep.

Measurements of human joint motion frequently involve the use of opto-electronic and other motion analysis systems where some type of makers are used to establish joint motion within a global reference coordinate frame. Typically, this global reference coordinate frame is chosen to be most convenient for the person carrying out the experiment in which the joint motion is measured, and Euler angles are chosen as the measure of joint motion. Results, however, may be quite arbitrary and therefore rendered meaningless if the reference frame is not properly chosen with respect to the physical joint axis. In order to make a proper choice of coordinate axes in the reference frame, one must take into consideration both the location and the orientation of die physical joint axis relative to the reference frame's axes. In nature, joint axes can exist at any orientation and location relative to an arbitrarily chosen global reference frame. An axis that is not properly aligned with the global reference frame is therefore called an arbitrary axis. We demonstrate that errors result when measurements and calculations are

made in a global reference frame that is arbitrarily placed and oriented, with little regard for the physical axis. Slight offsets of global reference frame produce significant errors in recording rotations about the joint axis. We conclude that, in order to be able to reach valid conclusions from joint motion measurements, the reference frame with respect to which all are taken must be brought to the physical axis; furthermore, one of the reference axes must be aligned with the physical axis. Any other choice of reference axes will result in misleading an often erroneous results.

5520 Public Health

22376 (CONF-950168–Absts.) **The development and implementation of a geographic analysis system for population health and environmental risk assessment.** Medical Univ. of South Carolina, Charleston, SC (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-91SR18217. From 1995 CDC/ATSDR symposium on statistical methods: small area statistics in public health: design, analysis graphic and spatial methods; Atlanta, GA (United States); 25-26 Jan 1995. Order Number DE95013877. Source: OSTI; NTIS; GPO Dep.

Traditional approaches for the assessment of environmental exposure and health have employed data collection and analysis methods which are time-consuming and expensive as well as being limited to participation of subjects in selected geographic areas. As a component of an environmental risk assessment program, an alternate approach which utilizes a geographic information system has been initiated. The system utilizes a geo-coding process which enables the investigation and assessment of population data from the state level to the Census block level. This comprehensive system provides he capability of merging information from multiple data sources. For instance, cancer registry cases as well as other medical data bases involving cardiovascular, neurological, and immuno-suppressed conditions could be assessed as population indicators. These data can be analyzed with existing demographic and environmental exposure data. The pilot stud of the system incorporated cancer incidence cases to the block level. Complete ascertainment and quality control measures required a detailed, but manageable protocol. Such a system provides an efficient and timely data resource for environmental risk assessment. In addition, the system establishes a strong collaborative network amono investigators and government agencies.

22377 (LBL–36630-Rev.) **Use of density equalizing map projections (DEMP) in the analysis of childhood cancer in four California counties.** Merrill, D.W. Selvin, S.; Close, E.R.; Holmes, H.H. Lawrence Berkeley Lab., CA (United States). Apr 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950168–1-Rev.: 1995 CDC/ATSDR symposium on statistical methods: small area statistics in public health: design, analysis graphic and spatial methods, Atlanta, GA (United States), 25-26 Jan 1995). Order Number DE95012388. Source: OSTI; NTIS; GPO Dep.

In studying geographic disease distributions, one normally compares rates of arbitrarily defined geographic subareas (e.g. census tracts), thereby sacrificing the geographic detail of the original data. The sparser the data, the larger the subareas must be in order to calculate stable rates. This dilemma is avoided with the technique of Density Equalizing Map Projections (DEMP). Boundaries of geographic subregions are adjusted to equalize population density over the entire study area. Case locations plotted on the transformed map should have a uniform distribution if the underlying disease rates are constant. The density equalized map portrays both individual cases and rates, and can be understood by untrained observers. Simple statistical techniques can be used to test the uniformity of the transformed map. This report describes application of the DEMP technique to a sizeable 'real-world' data set: 401 childhood cancer cases occurring between 1980 and 1988 in four California counties. In an earlier analysis of the same data, the California Department of Health Services (DHS) calculated rates for 101 communities and found no significant geographic variability. The DDS 1980–88 population estimates are no longer available, so in this analysis 1980 Census data were used; geographic units were 262 census tracts. A k'th nearest neighbor analysis, corrected for boundary effects and for within-tract variability, provides strong evidence for geographic nonuniformity in tract rates ($\rho < 10^{-4}$). No such effect is observed for artificial cases generated under the assumption of constant rates. Pending reanalysis with 1980-88 population estimates, no epidemiologic conclusions can be drawn at this time.

22378 (DOE/ER/14004–T2) **The molecular characterization of the lignin-forming peroxidase. Progress summary report, April 1, 1992–March 31, 1995.** Lagrimini, L.M. Ohio State Univ., Columbus, OH (United States). Dept. of Horticulture. [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER14004. Order Number DE95012449. Source: OSTI; NTIS; GPO Dep.

My research program focuses entirely on the study of the lignin-forming peroxidase of tobacco. Ever since our cloning and sequencing of the first plant peroxidase cDNA, we have pioneered in the introduction of the tools of molecular biology to the study of plant peroxidases. A significant part of our effort has been focused on the construction and analysis of transgenic plants which either over- or under-express the tobacco anionic peroxidase. This research has not only supported the role for this enzyme in lignification, but has opened the door to our understanding of additional metabolic functions including auxin metabolism and insect defense. As you will learn, this enzyme's role in auxin catabolism has lead to numerous phenotypes in transgenic plants. More recently, our attention has been directed towards the analysis of peroxidase gene expression. From this work we have learned that the anionic peroxidase gene is expressed at high levels in the xylem-forming cells, epidermis, and trichomes. This expression pattern supports its role lignification and hose defenses. We have also learned that this gene is down-regulated by auxin which indicates a strong relationship between auxin and the anionic peroxidase. 12 figs.

22379 (IAEA-R–5146-F) **Isotopic (^{18}O,^{2}H) characterization and modelling of the spatial-time variability of water transfers at the vegetation blanket interface. Final report for the period December 1988 - December 1989.** Bariac, T. (Universite Pierre et Marie Curie, Paris (France). Lab. de Biogeochimie Isotopique). International Atomic Energy Agency, Vienna (Austria). 1989. 45p. (In French). Order Number DE95631108. Source: OSTI; NTIS (US Sales Only); INIS.

The main objectives of the study were: (1) analysis of the spatial (40m) evolution of the heavy isotopes content in foliar water without and with transpiration; (2) analysis of the climatic parameters influence on the content of heavy isotopes in foliar water; (3) analysis of relations between the isotopic composition of the foliar water and of the atmosphere vapors collected up to 100m high. Figs and tabs.

22380 (IC–95/67) **Analysis of a general age-dependent vaccination model for a vertically transmitted disease.** El Doma, M. International Centre for Theoretical Physics, Trieste (Italy). May 1995. 20p. Order Number DE95633291. Source: OSTI; NTIS (US Sales Only); INIS.

A SIR epidemic model of a general age-dependent vaccination for a vertically as well as horizontally transmitted disease is investigated when the total population is time dependent, and fertility, mortality and removal rates depend on age. We establish the existence and the uniqueness of the solution and obtain the asymptotic behaviour for the solution. For the steady state solution a critical vaccination coverage which will eventually eradicate the disease is determined. (author). 18 refs.

Materials on using methods labelled atoms in animal and plant breeding also on usage of radiation mutants and their usage in selection, on development and usage of equipment for radionuclide removal from food chains were presented. New radioprotective compounds were assessed.

22396 (UCRL-ID–119073) **Feasibility study of a microwave radar system for agricultural inspection.** Okelo-Odongo, S. Lawrence Livermore National Lab., CA (United States). 3 Oct 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95011514. Source: OSTI; NTIS; GPO Dep.

The feasibility of an impulse radar system for agricultural inspection is investigated. This system would be able to quickly determine the quality of foodstuffs that are passed through the system. A prototype was designed at the Lawrence Livermore National Laboratory and this report discusses it's evaluation. A variety of apples were used to test the system and preliminary data suggests that this technology holds promise for successful application on a large scale in food processing plants.

(Argonne National Lab., IL (United States)); Felcher, P.; Chin-Mei Chang-Liu. Argonne National Lab., IL (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95012218. Source: OSTI; NTIS; GPO Dep.

Experiments examined the effects of radiation dose-rate and protein synthesis inhibition expression of cytoskeletal and matrix elements in Syrian hamster embryo cells. Results demonstrated little effect of dose-rate for neutrons when comparing expression of α-tubulin and fibronectin genes. Cycloheximide repressed accumulation of α-tubulin-mRNA following exposure to high dose-rate neutrons or γ rays. Cycloheximide did not affect accumulation of actin mRNA. Cycloheximide abrogated induction of fibronectin-mRNA which occurred following exposure to γ rays and high dose-rate neutrons. These results suggest a role for labile proteins in the maintenance of α-tubulin and fibronectin mRNA accumulation following exposure to radiation. 24 refs., 3 tabs.

22398 (ANL/CMB/PP–85889) **HIV transcription is induced in dying cells.** Woloschak, G.E. (Argonne National Lab., IL (United States)); Chang-Liu, Chin-Mei; Schreck, S. Argonne National Lab., IL (United States). [1995]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95012211. Source: OSTI; NTIS; GPO Dep.

Using HeLa cells stably transfected with an HIV-LTR-CAT construct, we demonstrated a peak in CAT induction that occurs in viable (but not necessarily cell-division-competent) cells 24 h following exposure to some cell-killing agents. γ rays were the only cell-killing agent which did not induce HIV transcription; this can be attributed to the fact that γ-ray-induced apoptotic death requires functional p53, which is not present in HeLa cells. For all other agents, HIV-LTR induction was dose-dependent and correlated with the amount of cell killing that occurred in the culture. 14 refs., 4 figs., 1 tab.

22399 (ANL/EA/CP–83892) **Radiological dose assessment related to management of naturally occurring radioactive materials generated by the petroleum industry.** Smith, K.P. (Argonne National Lab., IL (United States). Environmental Assessment Div.); Blunt, D.L.; Williams, G.P.; Tebes, C.L. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950333–2: 2. SPE/EPA exploration and production environmental conference: government and industry working together to find cost effective approaches to protecting the environment, Houston, TX (United States), 27-29 Mar 1995). Order Number DE95011960. Source: OSTI; NTIS; INIS; GPO Dep.

A preliminary radiological dose assessment related to equipment decontamination, subsurface disposal, landspreading, equipment smelting, and equipment burial was conducted to address concerns regarding the presence of naturally occurring radioactive materials in production waste streams. The assessment evaluated the relative dose of these activities and included a sensitivity analysis of certain input parameters. Future studies and potential policy actions are recommended.

22400 (BNL–61615) **Safety assessment and surveillance of decommissioning operations at DOE's nuclear facilities.** Cowgill, M.G. (Brookhaven National Lab., Upton, NY (United States)); Prochnow, D.; Worthington, P.R. Brookhaven National Lab., Upton, NY (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950216–147: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95013320. Source: OSTI; NTIS; INIS; GPO Dep.

A description is provided of a systematic approach currently being developed and deployed at the Department of Energy to obtain assurance that post-operational activities at nuclear facilities will be conducted in a safe manner. Using this approach, personnel will have available a formalized set of safety principles and associated question sets to assist them in the conducting of safety assessments and surveillance. Information gathered through this means will also be analyzed to determine if there are any generic complex-wide strengths or deficiencies associated with decommissioning activities and to which attention should be drawn.

22401 (CONF-9309110–Summ.) **[Malignant transformation of human fibroblasts by neutrons and by gamma radiation: Relationship to mutations induced].** Michigan State Univ., East

Lansing, MI (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-93ER61625. From International symposium on molecular mechanisms of radiation and chemical carcinogen-induced cell transformation; Mackinac Island, MI (United States); 19-24 Sep 1993. Order Number DE95009803. Source: OSTI; NTIS; GPO Dep.

A brief overview if provided of selected reports presented at the International Symposium on Molecular Mechanisms of Radiation- and Chemical Carcinogen-Induced Cell Transformation held at Mackinac Island, Michigan on September 19-23, 1993.

22402 (DOE/ER/61009–T1) **Low dose neutron late effects: Cataractogenesis. Final progress report, April 1, 1992–March 31, 1993.** Worgul, B.V. Columbia Univ., New York, NY (United States). 1 Apr 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER61009. Order Number DE95011919. Source: OSTI; NTIS; INIS; GPO Dep.

The work is formulated to resolve the uncertainty regarding the relative biological effectiveness (RBE) of low dose neutron radiation. The study exploits the fact that cataractogenesis is sensitive to the inverse dose-rate effect as has been observed with heavy ions and was an endpoint considered in the follow-up of the A-bomb survivors. The neutron radiations were initiated at the Radiological Research Accelerator facility (RARAF) of the Nevis Laboratory of Columbia University. Four week old ($\pm$ 1 day) rats were divided into eight dose groups each receiving single or fractionated total doses of 0.2, 1.0, 5.0 and 25.0 cGy of monoenergetic 435 keV neutrons. Special restraining jigs insured that the eye, at the midpoint of the lens, received the appropriate energy and dose with a relative error of $\pm$ 5%. The fractionation regimen consisted of four exposures, each administered at three hour ($\pm$ 1 minute) intervals. The neutron irradiated groups were compared to rats irradiated with 250 kVp X-rays in doses ranging from 0.5 to 7 Gy. The animals were examined on a biweekly basis utilizing conventional slit-lamp biomicroscopy and the Scheimpflug Slit Lamp Imaging System (Zeiss). The follow-ups, which proceeded for over 2 years, are now complete. This proved essential inasmuch as given the extremely low doses which were utilized, clinically detectable opacities were not anticipated until a significant fraction of the life span has lapsed. The results have exceeded all expectations.

22403 (IAEA-TECDOC–795, pp. 64-112) **Estimation of mean exposure in region CB.** Bucina, I.; Prouza, Z.; Mueller, H.; Malatova, I. International Atomic Energy Agency, Vienna (Austria). Apr 1995. In *Validation of models using Chernobyl fallout data from the Central Bohemia region of the Czech Republic. Scenario CB. First report of the VAMP Multiple Pathways Assessment Working Group. Part of the IAEA/CEC Co-ordinated Research Programme on the Validation of Environmental Model Predictions (VAMP).* 334p. Order Number DE95633388. Source: OSTI; NTIS (US Sales Only); INIS.

Radiation exposure of people via the different pathways (external exposure from cloud and ground, internal exposure from inhalation and ingestion) has been an endpoint of the model calculation in scenario CB for which no direct measurements exist. However, some additional information has been made available which was given to the modelers in the CB scenario. Based on all information available at present, a best estimate of radiation exposure from ^{137}Cs in CB is given here. Due to the assessment tasks, this estimation considers the effective dose equivalent for adult persons (age 20 years at time of deposition), averaged over the whole region CB. Refs, figs and tabs.

22404 (IAEA-TECDOC–795, pp. 197-204) **Evaluation of HUMOD model's performance for CB scenario.** Hu Erbang (China Inst. for Radiation Protection, Taiyuan, Shanxi (China)); Liu Xingzeng; Zhang Heyuan. International Atomic Energy Agency, Vienna (Austria). Apr 1995. In *Validation of models using Chernobyl fallout data from the Central Bohemia region of the Czech Republic. Scenario CB. First report of the VAMP Multiple Pathways Assessment Working Group. Part of the IAEA/CEC Co-ordinated Research Programme on the Validation of Environmental Model Predictions (VAMP).* 334p. Order Number DE95633388. Source: OSTI; NTIS (US Sales Only); INIS.

HUMOD is a equilibrium compartmental model developed for CB scenario. Internal exposure due to inhalation and ingestion as well as the external exposure from the passing cloud and deposited ground activity are included. The main part of the model is for simulation of ingestion pathway. 5 figs, 2 tabs.

22405 (IAEA-TECDOC–795, pp. 213-222) **Evaluation of ENCONAN performance for CB exercise.** Kliment, V. (National Inst. of Public Health, Prague (Czech Republic)). International Atomic Energy Agency, Vienna (Austria). Apr 1995. In *Validation of models using Chernobyl fallout data from the Central Bohemia region of the Czech Republic. Scenario CB. First report of the VAMP Multiple Pathways Assessment Working Group. Part of the IAEA/CEC Co-ordinated Research Programme on the Validation of Environmental Model Predictions (VAMP).* 334p. Order Number DE95633388. Source: OSTI; NTIS (US Sales Only); INIS.

ENCONAN (ENvironmental COntamination ANalysis) is a model of food chain contamination and of assessment of committed dose effective equivalent by inhalation and ingestion after an accident at nuclear facilities for cesium radioisotopes. 4 refs, 5 figs, 4 tabs.

22406 (IAEA-TECDOC–795, pp. 287-291) **HEDR - Comparison of model predictions with observations.** Napier, B.A. (Battelle Pacific Northwest Lab., Richland, WA (United States)). International Atomic Energy Agency, Vienna (Austria). Apr 1995. In *Validation of models using Chernobyl fallout data from the Central Bohemia region of the Czech Republic. Scenario CB. First report of the VAMP Multiple Pathways Assessment Working Group. Part of the IAEA/CEC Co-ordinated Research Programme on the Validation of Environmental Model Predictions (VAMP).* 334p. Order Number DE95633388. Source: OSTI; NTIS (US Sales Only); INIS.

HEDR model was developed to allow calculation of doses to people over a large area, resulting from releases of radionuclides over a long period of time. It is structured to allow concurrent calculation for many geographic areas, allowing for transfer of food products between areas.

22407 (INIS-BR–3506) **Lung inhomogeneity effect in the radiotherapy treatments using the BPW-34 photodiode detector.** Jesus Lopes Filho, F. de. Pernambuco Univ., Recife, PE (Brazil). Dept. de Energia Nuclear. Sep 1990. 71p. (In Portuguese). Order Number DE95631124. Source: OSTI; NTIS (US Sales Only); INIS.

PRONUCLEAR. Tese de Mestrado, 53.

The presence, in the radiation field, of regions with composition and/or differing from soft tissue may significantly affect the tumoral dose distribution in radiotherapy treatments. The effect of the lung on the dose distribution in the near by tissues was studied with high energy rays $c\gamma$ of ^{60} Co and 10 MV, 6 MV - X-ray and using a BPW-34 photodiode as a detector. The results obtained showed that the tumoral dose is reduced in the region anterior to the lung, due to backscattering reduction, whereas it is enhanced beyond the lung due to the lower attenuation in the inhomogeneity. (author). 36 refs, 11 figs, 12 tabs.

22408 (INIS-mf–14548) **SSDL Newsletter. No.32.** International Atomic Energy Agency, Vienna (Austria); World Health Organization, Geneva (Switzerland). Dec 1993. 27p. Order Number DE95633405. Source: OSTI; NTIS (US Sales Only); INIS.

The newsletter includes two articles presented at the consultants' meeting on 'External quality audit of the absorbed dose intercomparison method used by IAEA' held in Vienna between 20-22 December 1993. A separate abstract was prepared for each item. Refs, figs and tabs.

22409 (INIS-mf–14548, pp. 3-13) **Determination of calibration factors in terms of air kerma and absorbed dose to water in the ^{60}Co γ rays.** Boutillon, M. (Bureau International des Poids et Mesures (BIPM), 92 - Sevres (France)); Perroche, A.M. International Atomic Energy Agency, Vienna (Austria); World Health Organization, Geneva (Switzerland). Dec 1993. 27p. In *SSDL Newsletter. No.32.* Order Number DE95633405. Source: OSTI; NTIS (US Sales Only); INIS.

The method of calibration of an instrument, as performed at the BIPM in the ^{60}Co field in terms of air kerma or absorbed dose to water, is described in detail. The influence of various parameters which can affect the calibration factor is analyzed. The uncertainty is of order 0.3% and 0.5% for calibration factors in terms of air

kerma and of absorbed dose to water, respectively. (author). 14 refs, 10 figs, 3 tabs.

Short communication. BIOLOGICAL REPAIR/stimulation; RADIATION SYNDROME/post-irradiation therapy; STIMULATION; BONE MARROW CELLS; LABORATORY ANIMALS; STEM CELLS; TRANSPLANTS

22414 (INIS-RU–406, pp. 25) **Morphofunctional assessment of dimethpramide effect on the cells producing biogenic amines in case of acute intestinal radiation syndrome.** Alekseeva, I.I.; Legeza, V.I.; Pozharisskaya, T.D.; Shagoyan, M.G. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. RADIATION SYNDROME/response modifying factors; RESPONSE MODIFYING FACTORS/amides; AMINES; BIOLOGICAL FUNCTIONS; CRYPT CELLS; DOGS; GAMMA RADIATION; GASTROINTESTINAL TRACT; MAST CELLS; MORPHOLOGICAL CHANGES; RADIATION DOSES; RATS; AMIDES; SYMPTOMS; TIME DEPENDENCE

22415 (INIS-RU–406, pp. 26) **Adaptogens of vegetative origin a possible method of preventing psychoemotional stress in case of operating with radioactive substances.** Astrov, V.V.; Antushevich, A.E. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. DISEASE INCIDENCE/medicinal plants; RADIOISOTOPES/radiological personnel; RADIOLOGICAL PERSONNEL/disease incidence; MEDICAL SURVEILLANCE; MENTAL DISORDERS; RADIOISOTOPES; RESPONSE MODIFYING FACTORS

22416 (INIS-RU–406, pp. 27) **To the problem on radioprotective efficiency of chemical preparations.** Bojko, V.N. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. CHEMOTHERAPY/radioprotective substances; RADIOPROTECTIVE SUBSTANCES/biological radiation effects; CHEMOTHERAPY; FEMALES; GAMMA RADIATION; IMMUNITY; LETHAL IRRADIATION; MICE; RADIATION DOSES; SURVIVAL CURVES; TIME DEPENDENCE

22417 (INIS-RU–406, pp. 28) **Effect of thymogen, diethylstilberone and cystamine administration on the indexes of nonspecific resistivity.** Bojko, V.N. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. RADIATION PROTECTION/biological radiation effects; RADIOSENSITIVITY/radioprotective substances; BIOLOGICAL FUNCTIONS; IONIZING RADIATIONS; LABORATORY ANIMALS; RADIOSENSITIVITY

22418 (INIS-RU–406, pp. 29) **Radioprotective and anticarcinogenic activity of glutapyrone under chronic irradiation of mice.** Bokk, M.I.; Egorov, A.E.; Ivanov, E.V.; Ponomareva, T.V. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. CHRONIC IRRADIATION/biological radiation effects; CHRONIC IRRADIATION/radioprotective substances; RADIOPROTECTIVE SUBSTANCES/carcinogenesis; GAMMA RADIATION; HALF-LIFE; LIFE SPAN; MICE; RADIATION DOSES; CARCINOGENESIS; SURVIVAL TIME

22419 (INIS-RU–406, pp. 32) **Cytogenetic study of radioprotective effect of compounds of various chemical closes.** Zhakovko, E.B.; Krasil'nikov, I.I.; Deev, S.P. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of*

radiobiology. Exhibition Radiobiology for practice. Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. ORGANIC COMPOUNDS/radioprotective substances; SUBLETHAL IRRADIATION/chromosomal aberrations; SUBLETHAL IRRADIATION/radiation protection; BONE MARROW CELLS; GAMMA RADIATION; RATS; WHOLE-BODY IRRADIATION

22420 (INIS-RU–406, pp. 33) **Experimental substantiation of application of perfluorane in case of combined radiation injuries complicated by hemorrhage shock.** Ivanchenko, A.V.; Yurkevich, Yu.V.; Sinchuk, V.I. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. BLOOD SUBSTITUTES/biological radiation effects; DOGS/gamma radiation; DOGS/hemorrhage; ANOXIA; BIOLOGICAL SHOCK; DOGS; HEMORRHAGE; RESPONSE MODIFYING FACTORS

22421 (INIS-RU–406, pp. 34) **Modifying effect of radioprotective substances of B-lymphocytes dynamics in mice spleen under irradiation.** Lebedev, S.N.; Morozova, I.N.; Deev, S.P.; Antushevich, A.E. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. LYMPHOCYTES/biological radiation effects; LYMPHOCYTES/response modifying factors; RADIOPROTECTIVE SUBSTANCES/lymphocytes; BIOLOGICAL FUNCTIONS; IMMUNITY; LYMPHOCYTES; MICE; RADIATION DOSES; SPLEEN; TIME DEPENDENCE

22422 (INIS-RU–406, pp. 35) **Selection of risk groups of diseases on the contaminated areas using a new express method-test of P-protein determination in human blood serum.** Margulis, G.U. (Vsesoyuznyj Nauchno-Issledovatel'skij Inst. Sel'skokhozyajstvennyj Biotekhnologii RASKhN, Moscow (Russian Federation)); Bartova, L.M.; Oganyan, R.R.; Karlina, L.V. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. HUMAN POPULATIONS/health hazards; REACTOR ACCIDENTS/risk assessment; BLOOD SERUM; CHERNOBYLSK-4 REACTOR; CONTAMINATION; DISEASE INCIDENCE; PROTEINS; RADIOACTIVITY

22423 (INIS-RU–406, pp. 37) **Effect of chitosane of migration, proliferation and differentiation of stem cells and system of cyclic nucleotides.** Nikitin, V.Yu. (Voenno-Meditsinskaya Akademiya, Leningrad (Russian Federation)). RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. BLOOD FORMATION/lethal irradiation; CHITIN/stem cells; STEM CELLS/biological repair; STEM CELLS/cell proliferation; BONE MARROW; CHITIN; DRUGS; LIVER; MICE; RADIATION DOSES; RATS; SPLEEN; THYMUS; TIME DEPENDENCE

22424 (INIS-RU–406, pp. 38) **Application of vitamins and antioxidants for decreasing mutation frequency induced by gamma radiation.** Podlutskij, A.Ya. (RAN, Pushchino-na-Oke (Russian Federation). Inst. Teoreticheskoj i Ehksperimental'noj Biofiziki); Gaziev, A.I. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. GENE MUTATIONS/radioprotective substances; RADIOPROTECTIVE SUBSTANCES/antioxidants; RADIOPROTECTIVE SUBSTANCES/vitamins; AGE DEPENDENCE; DOSE-RESPONSE RELATIONSHIPS; GAMMA RADIATION; LYMPHOCYTES; MICE; RADIATION DOSES; RADIATION PROTECTION; ANTIOXIDANTS; VITAMINS; SPLEEN

22425 (INIS-RU–406, pp. 39) **New effective radioprotective compounds derivatives of sulfur-containing protective substances.** Sverdlov, A.G. (RAN, Sankt-Peterburg (Russian Federation). Inst. Yadernoj Fiziki); Grachev, S.A.; Kropachev, E.V.; Drobchenko, S.N.; Niranrova, N.G.; Timoshenko, S.I. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. ORGANIC SULFUR COMPOUNDS/radioprotective substances; AMINES; LABORATORY ANIMALS; ORGANIC PHOSPHORUS COMPOUNDS; RADIATION PROTECTION; TOXICITY

22426 (INIS-RU–406, pp. 40) **State of superspiral DNA of lymphocytes and immunity indices of people following 5 years after the actione of factors of radiation accident.** Smirnov, V.S. (Voenno-Meditsinskaya Akademiya, Sankt-Peterburg (Russian Federation)); Dulatova, N.Kh. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. LYMPHOCYTES/delayed radiation effects; REACTOR ACCIDENTS/immunity; CHERNOBYLSK-4 REACTOR; DNA; LYMPHOCYTES; MEDICAL SURVEILLANCE; MEN; RADIATION DOSES; IMMUNITY

22427 (INIS-RU–406, pp. 42) **Effect of detoxication on the state of liver of irradiated animals.** Chigareva, N.G.; Legeza, V.I.; Abdel', Yu.A.; Myasoedov, A.F.; Petkevich, N.V. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. LIVER/early radiation effects; LIVER/post-irradiation therapy; BIOLOGICAL FUNCTIONS; BIOLOGICAL HALF-LIFE; DRUGS; ENZYME ACTIVITY; GAMMA RADIATION; LIPIDS; LIVER; MALES; OXIDATION; RADIATION SYNDROME; RATS; TIME DEPENDENCE

22428 (INIS-RU–406, pp. 43) **Efficiency of curative effect of plasmaphoresis at early terms of acute radiation syndrome.** Chigareva, N.G.; Legeza, V.I.; Abdul', Yu.A.; Androkhina, V.I.; Artemenko, A.G. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. RADIATION SYNDROME/post-irradiation therapy; BLOOD COUNT; DOGS; EARLY RADIATION EFFECTS; GAMMA RADIATION; HISTAMINE; SURVIVAL CURVES; TIME DEPENDENCE

22429 (INIS-RU–406, pp. 44) **Effect of interleukine-1 on the recovery of wounds in case of combined radiation injury.** Yurkevich, Yu.V.; Sinchuk, V.I.; Pozharisskaya, T.D.; Vorob'ev, A.V.; Prokop'ev, A.A. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. RATS/lethal irradiation; RATS/wounds; WOUNDS/biological repair; WOUNDS/post-irradiation therapy; DRUGS; IMMUNITY; MALES; PATHOLOGICAL CHANGES; RATS; WOUNDS; SKIN

22430 (INIS-RU–406, pp. 45) **Synergetic effect of ionizing radiation and microdements on the seeds of spring wheat.** Kostin, V.I. (Ul'yanovskij Sel'skokhozyajstvennyj Inst., Ul'yanovsk (Russian Federation)); Cherkasova, S.N. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. SEEDS/ionizing radiations; SYNERGISM/biological effects; BIOCHEMISTRY; COPPER SULFATES; CROPS; MANGANESE SULFATES; SEEDS; SYNERGISM; TRACE AMOUNTS; WHEAT; ZINC SULFATES

22431 (INIS-RU–406, pp. 46) **Effect of ionizing radiation and microelements on hardness of winter wheat.** Kostin, V.I. (Ul'yanovskij Sel'skokhozyajstvennyj Inst., Ul'yanovsk (Russian Federation)); Levanov, A.V. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. SEEDS/gamma radiation; SEEDS/trace amounts; WHEAT/stability; ELEMENTS; RADIATION DOSES; SEEDS; SURVIVAL TIME; WHEAT; STABILITY

22432 (INIS-RU–406, pp. 47) **Laser modification of ionizing radiation effect for the aims of selection.** Budagovskij, A.V. (Vsesoyuznyj Nauchno-Issledovatel'skij Inst. Genetiki i Selektsii Plodovykh Rastenij, Michurinsk (Russian Federation)); Mokrousova, G.I.; Gudi, G.A. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. LASER RADIATION/response modifying factors; RESPONSE MODIFYING FACTORS/biological repair; BIOLOGICAL FUNCTIONS; DOSE-RESPONSE RELATIONSHIPS; IONIZING RADIATIONS; LETHAL MUTATIONS; PLANT BREEDING; PLANTS; SEEDS

22433 (INIS-RU–406, pp. 49) **Forestry methods in technology of decreasing of radionuclide transfer on populated and agricultural areas.** Bykov, A.V.; Lysikov, A.B.; Melankholin, P.N. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. CONTAMINATION/radioecological concentration; FORESTRY/remedial action; FORESTS/contamination; FORESTS/delayed radiation effects; CHERNOBYLSK-4 REACTOR; CONTAMINATION; DOSE RATES; FALLOUT; FOREST LITTER; FORESTRY; FORESTS; GROUND COVER; LAND USE; RADIOACTIVITY; REACTOR ACCIDENTS; SOILS

22434 (INIS-RU–406, pp. 53) **Best radiomutants of tomato by biochemical features and their investigation in selection.** Korchemnaya, N.A. (VNII Rastenievodstva, Moscow (Russian Federation)). RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. TOMATOES/radiation induced mutants; BIOCHEMISTRY; CROPS; GAMMA RADIATION; HYBRIDIZATION; PLANT BREEDING; TOMATOES

22435 (INIS-RU–406, pp. 54) **Preparation of mutants of Gracila-ridal.** Kulepanov, V.N. (Dal'nevostochnyj Gosudarstvennyj Univ., Vladivostok (Russian Federation)); Ivanovskij, Yu.A. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. ALGAE/auxins; ALGAE/gamma radiation; RADIATION INDUCED MUTANTS/plant breeding; ALGAE; AUXINS; RADIATION DOSES; REPRODUCTIVE DISORDERS

22436 (INIS-RU–406, pp. 55) **Protective effect of ammonium cation on development of radiation injury in plants.** Kurganova, L.N. (Gor'kovskij Gosudarstvennyj Univ., Gorki (Russian Federation)). RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. PEAS/radiation injuries; RADIATION INJURIES/ammonium compounds; BIOLOGICAL RECOVERY; CARBOXYLIC ACIDS; CELL MEMBRANES; CHLOROPLASTS; LIPIDS; PEAS; PHOTOSYNTHESIS; RADIATION DOSES; RADIATION PROTECTION; SEEDS

22437 (INIS-RU–406, pp. 60) **First gamma field in Russia: results, problem and prospects of investigation.** Vilenskij, E.R. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. PLANTS/chronic irradiation; BIOLOGICAL RADIATION EFFECTS; DOSE RATES; GAMMA RADIATION; IRRADIATION PLANTS; ONTOGENESIS; PLANTS; RADIOSENSITIVITY

22438 (INIS-RU–406, pp. 63) **Unit for milk decontamination using tseolite.** Donskaya, G.A.; Mar'in, V.A. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. CHERNOBYLSK-4 REACTOR/reactor accidents; MILK/decontamination; MILK/zeolites; CESIUM ISOTOPES; CONTAMINATION; EFFICIENCY; ION EXCHANGE; MILK; DECONTAMINATION; ZEOLITES; PILOT PLANTS; RADIOACTIVITY; SPECIFICATIONS

22439 (INIS-RU–406, pp. 65-66) **Biological effect of ferrocyanides and their adsorbability in laboratory and industrial**

tests. Mayakov, E.N.; Budarkov, V.A.; Torubarova, A.A.; Volosevich, L.A.; Mishin, A.M.; Yastrebkov, Yu.A. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. CESIUM ISOTOPES/food chains; FERROCYANIDES/biological effects; ADSORBENTS; CHERNOBYLSK-4 REACTOR; COWS; FERROCYANIDES; MEAT; MILK; POTASSIUM COMPOUNDS; RADIOISOTOPES; RADIONUCLIDE MIGRATION; REACTOR ACCIDENTS; SHEEP; TOXICITY

22440 (INIS-RU–406, pp. 67) **Antiactinic properties of mineralogic substate.** Surgucheva, L.M.; Makarov, N.V.; Budarkov, V.A. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. RADIATION INJURIES/radioprotective substances; RADIOPROTECTIVE SUBSTANCES/substrates; AMINO ACIDS; BLOOD FORMATION; ELEMENTS; ENZYMES; GAMMA RADIATION; HORMONES; LIFE SPAN; MICE; RADIATION DOSES; RADIATION PROTECTION; SUBSTRATES; SURVIVAL TIME; TIME DEPENDENCE; TRACE AMOUNTS

22441 (INIS-RU–406, pp. 68) **Application of test of endogeneous spleen colony formation for selection of antiactinic preparations.** Surgucheva, L.M.; Budarkov, V.A. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. RADIOPROTECTIVE SUBSTANCES/cfu; BIOLOGICAL RADIATION EFFECTS; GAMMA RADIATION; IMMUNITY; MICE; RADIATION DOSES; CFU

22442 (INIS-RU–406, pp. 69) **Application low dose irradiation for increase of chicken productivity.** Belov, A.D. (Moskovskaya Veterinarnaya Akademiya, Moscow (Russian Federation)); Pak, V.V.; Kaushanskij, D.A.; Kusurova, Z.G. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. CHICKENS/low dose irradiation; CHICKENS/reproduction; REPRODUCTION/stimulation; BLOOD FORMATION; CHICKENS; REPRODUCTION; EGGS; GAMMA RADIATION; PROGENY; RADIATION DOSES; STIMULATION; X RADIATION

22443 (INIS-RU–406, pp. 70) **Methods of radiation biotechnology in turkey breeding.** Pokrovskij, B.S. (Kazanskij Veterinarnyj Inst., Kazan (Russian Federation)); Kirshin, V.A. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. FOWL/mass rearing; LOW DOSE IRRADIATION/progeny; BIOLOGICAL FUNCTIONS; EGGS; EMBRYOS; ENDOCRINE GLANDS; FOWL; GAMMA RADIATION; PROGENY; MORTALITY

22444 (INIS-RU–406, pp. 71) **Functional state of thyroid of chicken in case of X-irradiation of eggs.** Belov, A.D. (Moskovskaya Veterinarnaya Akademiya, Moscow (Russian Federation)); Kusurova, Z.G.; Rogozhina, L.V.; Ukolova, Yu.M. RAN, Moscow (Russian Federation). Nauchnyj Sovet po Problemam Radiobiologii. 1994. 87p. (In Russian). (CONF-9404263–: All-Russia conference of applied aspects of radiobiology, Moscow (Russian Federation), 19-20 Apr 1994). In *All-Russian conference on applied aspects of radiobiology. Exhibition Radiobiology for practice.* Order Number DE95632291. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. EGGS/x radiation; THYROID/biological functions; BLOOD SERUM; CHICKENS; EGGS; HORMONES; RADIATION DOSES; RADIOIMMUNOASSAY; THYROID; TIME DEPENDENCE

22445 (INIS-RU–406, pp. 72) **Application of various immunodulators for increasing natural resistance of calves in conditions of the contaminated areas.** Belov, A.D. Laboratory activities for FY94 included: evaluation of decontamination of Tc by gas-phase techniques, evaluation of diluted ClF_3 for removing U deposits, evaluation of potential hazard of wet air inlekage into a vessel containing ClF_3, planning and preparation for experiments to assess hazard of rapid reaction of ClF_3 and hydrated UO_2F_2 or powdered Al, and preliminary evaluation of compatibility of Tenic valve seat material.

22457 (LA–12952-MS) **Determination of plutonium activity levels and $^{240}Pu/^{239}Pu$ isotope ratios in bone collected from nonoccupationally-exposed individuals living in Colorado.** Efurd, D.W.; Benjamin, T.M.; Aguilar, R.D.; Roensch, F.R.; Perrin, R.E.; Gonzales, E.R.; McInroy, J.F. Los Alamos National Lab., NM (United States). Apr 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95010555. Source: OSTI; NTIS; INIS; GPO Dep.

Los Alamos scientists measured $^{239+240}Pu$ alpha activities and $^{240}Pu/^{239}Pu$ atom ratios in bone tissues collected from Colorado residents who were not occupationally exposed to this type of radioactivity. Bone tissues from 519 individuals were collected from 1975 to 1979 as part of an Environmental Protection Agency directed project to determine the effect of plutonium on people who live in areas surrounding the Rocky Flats Plant. Los Alamos selected 59 individuals who were suspected of having high plutonium body burdens based on the plutonium content of their livers. The plutonium activity level in the subset of bones analyzed in this study contained 7.8 $\pm$ 9.4 pCi $^{239+240}Pu$/10 kg wet weight. The average $^{240}Pu/^{239}Pu$ atom ratio was 0.182 $\pm$ 0.068; this ratio suggests that the plutonium detected in these individuals originated predominantly from global fallout.

Contract W-7405-ENG-36. (CONF-9504158–3: CAD/CAE conference, Atlanta, GA (United States), 19 Apr 1995). Order Number DE95014016. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents details about the GIS information system development to support reporting requirements of occupational safety regulations. This system is being designed to give information about the level of radiation in an area and to make this information readily available to all workers before entering any area.

22459 (NIRS-M–98, pp. 73-85) **The emergency medical programs of japan and foreign countries for radiation accidents in nuclear power stations.** Aoki, Yoshiro (Tokyo Univ. (Japan). Faculty of Medicine). National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). (CONF-9312105–: 21. National Institute of Radiological Sciences, Chiba (Japan), 2-3 Dec 1993). In *Dose assessment and approach to the safety for the public in the emergency. Proceedings.* 210p. Order Number DE95747912. Source: OSTI; NTIS; INIS.

In our country, the medical emergency programs for the people living near nuclear power stations are well organized, however, preparation of medical staffs who are well trained is considered to be not sufficient. In the USA, on call 24 hours response to a radiological emergency is provided and funded by Department of Energy(DOE) or electric companies. Especially, REAC/TS is a part of DOE response network, in which there are provided well-trained physicians, nurses, health physicists, coordinators and support personnels. In United Kingdom, National Radiological Protection Board(NRPB) is responsible to a radiological emergency program. Each nuclear power station has its own emergency program consisting of a team of physicians, nurses and health physicists. In France, French Atomic Energy Commission (CEA) is a responsible agency for a radiological emergency program. On call 24 hours response to a radiological emergency is provided in Fontenay-aux Roses Institute and Curie Institute. Curie Institute also responds to radiological emergencies in other countries at the request of WHO. In Germany(West Germany), compulsory assurance system covers a radiological emergency program and a radiological protection. There are seven centers in West Germany, in which well-trained medical staffs are provided against radiological injuries. In this report, I tried to propose a new concept about emergency medical programs for nuclear power station accidents in Japan. I think it is a very urgent theme to provide on call 24 hours radiological emergency program, in which patients suffered from acute radiation sickness with internal contamination or contaminated radiation burns will be treated without any trouble. We have to make our best efforts to complete basic or clinical research about radiation injuries including bone marrow transplantation, radioprotectors, chelating agents and radiation burns etc. (J.P.N.).

22460 (NIRS-M–98, pp. 86-105) **Whole-body counting and its application to the internal exposure measurement.** Mizushita, Seiichi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). (CONF-9312105–: 21. National Institute of Radiological Sciences, Chiba (Japan), 2-3 Dec 1993). In *Dose assessment and approach to the safety for the public in the emergency. Proceedings.* 210p. Order Number DE95747912. Source: OSTI; NTIS; INIS.

Whole-body counter is used to determine radioactivities in the body by detecting their gamma rays and the result is applied to estimate the internal dose. In accidental situations, whole-body counter is most effectively applied to evaluate the radiation effects of the body incurred by incorporation of radioactivities. It is generally used in the internal exposure monitoring program of radiation workers in nuclear installations. The detection limit is several tens Bq for the precise counter and several hundreds Bq for the small counter. The body burden and its retention with the time are observed by the measurement and the time integral of the activity for the dose evaluation is calculated. The more practical way of dose evaluation is made based on the estimation of intake from the observed body burden. Calibration of the counters is usually carried out using whole body anthropomorphic phantom. The intercomparison study using anthropometric phantoms of different size, adult, 11 years old and 3 years old, were carried out between JAERI, NIRS and PNC. Through this study, validation of the calibration data and body size effect on counting efficiency were investigated. The calibration network will be need to establish the hierarchy of the standardization of calibration of whole-body counter. The standardization is also required in accidental situations which ensure the results of the subsequent studies. The cooperative study for the calibration of whole-body counter for the purpose of investigation on health effect of low radiation dose are continuing between Ukraine and Japan from 1989. The results shows the validation of the calibration of the counter for the measurement of the public affected by Chernobyl accident. (author).

22461 (NIRS-M–98, pp. 106-120) **Exposure dose assessment using bioassay.** Suga, Shinichi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. (In Japanese). (CONF-9312105–: 21. National Institute of Radiological Sciences, Chiba (Japan), 2-3 Dec 1993). In *Dose assessment and approach to the safety for the public in the emergency. Proceedings.* 210p. Order Number DE95747912. Source: OSTI; NTIS; INIS.

Bioassay involves following steps: sampling, pre-treatment, chemical separation and counting of radioactivity. As bioassay samples, urines are usually used, although faecal analysis may be required in some occasions for example to assess intake of non-transferable radioactive materials. Nasal smear is a useful indicator of an inhalation case. Exhalation air is used to estimate the intake of tritiated water. Sample pre-treatment includes evaporation for concentration, wet ashing, dry ashing and co-precipitation. After adding small amount of nitric acid, the sample can be concentrated by 1/10 of initial volume, which may be used to identify γ-emitters. As the pre-treatment of urine, wet ashing is used for example for analysis of Pu, and co-precipitation is used for example for analysis of Sr. Dry ashing by electric furnace is usually adopted for faecal samples. Methods of chemical separation depend on the radionuclide(s) to be analysed. The detection limit depends also on radionuclide, and for example typical detection limits are 0.4Bq /l (volume of urine sample) for ^{89}Sr or ^{90}Sr, and 0.01 Bq /l with urine and 0.01 Bq per sample with faeces for ^{238}Pu, ^{239}Pu or ^{241}Am. Simpler methods can be used for some radionuclides: For example, radioactivity concentration of tritium can be determined by liquid scintillation counting of urine or condensed water from exhaled air, and natural uranium in urine can be quantified by using fluorometric method. In some circumstances, gross-α or gross-β analyses are useful for quick estimation. To estimate intakes by inhalation or by ingestion from bioassay results and to assess the committed dose equivalent, commonly available bases are the relevant publications by the ICRP and domestic guides and manuals that conform to the radiation protection regulations. (author).

22462 (NUREG–1492) **Regulatory analysis on criteria for the release of patients administered radioactive material.** Schneider, S. (Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications); McGuire, S.A.; Behling, U.H.; Behling, K.; Goldin, D. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; Cohen (S.) and Associates, Inc., McLean, VA (United States). May 1994. 31p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

The Nuclear Regulatory Commission (NRC) has received two petitions to amend its regulations in 10 CFR Parts 20 and 35 as they apply to doses received by members of the public exposed to patients released from a hospital after they have been administered radioactive material. While the two petitions are not identical they both request that the NRC establish a dose limit of 5 millisieverts (0.5 rem) per year for individuals exposed to patients who have been administered radioactive materials. This Regulatory Analysis evaluates three alternatives. Alternative 1 is for the NRC to amend its patient release criteria in 10 CFR 35.75 to use the more stringent dose limit of 1 millisievert per year in 10 CFR 20.1301(a) for its patient release criteria. Alternative 2 is for the NRC to continue using the existing patient release criteria in 10 CFR 35.75 of 1,110 megabecquerels of activity or a dose rate at one meter from the patient of 0.05 millisievert per hour. Alternative 3 is for the NRC to amend the patient release criteria in 10 CFR 35.75 to specify a

dose limit of 5 millisieverts for patient release. The evaluation indicates that Alternative 1 would cause a prohibitively large increase in the national health care cost from retaining patients in a hospital longer and would cause significant personal and psychological costs to patients and their families. The choice of Alternatives 2 or 3 would affect only thyroid cancer patients treated with iodine-131. For those patients, Alternative 3 would result in less hospitalization than Alternative 2. Alternative 3 has a potential decrease in national health care cost of $30,000,000 per year but would increase the potential collective dose from released therapy patients by about 2,700 person-rem per year, mainly to family members.

22463 (NUREG/CR–6112) **Impact of reduced dose limits on NRC licensed activities. Major issues in the implementation of ICRP/NCRP dose limit recommendations: Final report.** Meinhold, C.B. (Brookhaven National Lab., Upton, NY (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; Brookhaven National Lab., Upton, NY (United States). May 1995. 65p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (BNL-NUREG–52394). Source: OSTI; NTIS; GPO; INIS.

This report summarizes information required to estimate, at least qualitatively, the potential impacts of reducing occupational dose limits below those given in 10 CFR 20 (Revised). For this study, a questionnaire was developed and widely distributed to the radiation protection community. The resulting data together with data from existing surveys and sources were used to estimate the impact of three dose-limit options; 10 mSv yr^{-1} (1 rem yr^{-1}), 20 mSv yr^{-1} (2 rem yr^{-1}), and a combination of an annual limit of 50 mSv yr^{-1} (5 rem yr^{-1}) coupled with a cumulative limit, in rem, equal to age in years. Due to the somewhat small number of responses and the lack of data in some specific areas, a working committee of radiation protection experts from a variety of licensees was employed to ensure the exposure data were representative. The following overall conclusions were reached: (1) although 10 mSv yr^{-1} is a reasonable limit for many licensees, such a limit could be extraordinarily difficult to achieve and potentially destructive to the continued operation of some licensees, such as nuclear power, fuel fabrication, and medicine; (2) twenty mSv yr^{-1} as a limit is possible for some of these groups, but for others it would prove difficult. (3) fifty mSv yr^{-1} and age in 10s of mSv appear reasonable for all licensees, both in terms of the lifetime risk of cancer and severe genetic effects to the most highly exposed workers, and the practicality of operation.

22464 (PNL–10500-Pt.1) **Pacific Northwest Laboratory annual report for 1994 to the DOE Office of Energy Research Part 1: Biomedical sciences.** Park, J.F. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 109p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012231. Source: OSTI; NTIS; GPO Dep.

Research in the biomedical sciences at PNL is described. Activities reported include: inhaled plutonium in dogs; national radiobiology archives; statistical analysis of data from animal studies; genotoxicity of inhaled energy effluents; molecular events during tumor initiation; biochemistry of free radical induced DNA damage; radon hazards in homes; mechanisms of radon injury; genetics of radon induced lung cancer; and in vivo/in vitro radon induced cellular damage.

22465 (PNL–10523) **Multimedia Environmental Pollutant Assessment System (MEPAS®): Exposure pathway and human health impact assessment models.** Strenge, D.L.; Chamberlain, P.J. Pacific Northwest Lab., Richland, WA (United States). May 1995. 177p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012763. Source: OSTI; NTIS; GPO Dep.

The Multimedia Environmental Pollutant Assessment System (MEPAS) provides physics-based models for human health risk assessment for radioactive and hazardous pollutants. MEPAS analyzes pollutant behavior in various media (air, soil, groundwater and surface water) and estimates transport through and between media and exposure and impacts to the environment, to the maximum individual, and to populations. MEPAS includes 25 exposure pathway models, a database with information on more than 650 contaminants, and a sensitivity module that allows for uncertainty analysis. Four major transport pathways are considered in MEPAS: groundwater, overland, surface water, and atmospheric. This report describes the exposure pathway and health impact assessment component of MEPAS, which provides an estimate of health impacts to selected individuals and populations from exposure to pollutants. The exposure pathway analysis starts with pollutant concentration in a transport medium and estimates the average daily dose to exposed individuals from contact with the transport medium or a secondary medium contaminated by the transport medium. The average daily dose is then used to estimate a measure of health impact appropriate to the type of pollutant considered. Discussions of the exposure pathway models include the assumptions and equations used to convert the transport medium concentrations to exposure medium concentrations. The discussion for a given exposure pathway defines the transport pathways leading to the exposure, the special processes considered in determining the pollutant concentration in the exposure medium, and the exposure model used to estimate the average daily dose. Models for the exposure pathway and health impact assessments require definition of several parameters. A summary of the notation used for these parameters is provided.

22466 (STUK/ST-GUIDE–12.3) **Radioactivity of household water.** Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). 1994. 10p. Order Number DE95631118. Source: OSTI; NTIS; INIS.

Translation. The original text in Finnish is published under the same guide number. The guide is valid from 1 September 1993 and will remain in force until further notice.

The guide presents the safety requirements to limit the radiation exposure due to the radioactive nuclides in household water. The requirements does not apply during extraordinary circumstances, as during fallout due to an accident at a nuclear power station. (2 refs., 1 tab.).

22467 (UCRL-CR–120647) **Attachment of radon progeny to cigarette-smoke aerosols.** Biermann, A.H.; Sawyer, S.R. Lawrence Livermore National Lab., CA (United States). May 1995. 42p. Sponsored by California Univ., Berkeley, CA (United States). DOE Contract W-7405-ENG-48. Order Number DE95013271. Source: OSTI; NTIS; INIS; GPO Dep.

The daughter products of radon gas are now recognized as a significant contributor to radiation exposure to the general public. It is also suspected that a synergistic effect exists with the combination cigarette smoking and radon exposure. We have conducted an experimental investigation to determine the physical nature of radon progeny interactions with cigarette smoke aerosols. The size distributions of the aerosols are characterized and attachment rates of radon progeny to cigarette-smoke aerosols are determined. Both the mainstream and sidestream portions of the smoke aerosol are investigated. Unattached radon progeny are very mobile and, in the presence of aerosols, readily attach to the particle surfaces. In this study, an aerosol chamber is used to contain the radon gas, progeny and aerosol mixture while allowing the attachment process to occur. The rate of attachment is dependent on the size distribution, or diffusion coefficient, of the radon progeny as well as the aerosol size distribution. The size distribution of the radon daughter products is monitored using a graded-screen diffusion battery. The diffusion battery also enables separation of the unattached radon progeny from those attached to the aerosol particles. Analysis of the radon decay products is accomplished using alpha spectrometry. The aerosols of interest are size fractionated with the aid of a differential mobility analyzer and cascade impactor. The measured attachment rates of progeny to the cigarette smoke are compared to those found in similar experiments using an ambient aerosol. The lowest attachment coefficients observed, $\sim 10^{-6}$ cm^3/s, occurred for the ambient aerosol. The sidestream and mainstream smoke aerosols exhibited higher attachment rates in that order. The results compared favorably with theories describing the coagulation process of aerosols.

22468 (UCRL-JC–119377) **Coupled light transport-heat diffusion model for laser dosimetry with dynamic optical properties.** London, R.A. (Lawrence Livermore National Lab., CA (United States)); Glinsky, M.E.; Zimmerman, G.B.; Eder, D.C.;

Jacques, S.L. Lawrence Livermore National Lab., CA (United States). 1 Mar 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950226–41: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-14 Feb 1995). Order Number DE95011747. Source: OSTI; NTIS; INIS; GPO Dep.

The effect of dynamic optical properties on the spatial distribution of light in laser therapy is studied via numerical simulations. A two-dimensional, time dependent computer program called LATIS is used. Laser light transport is simulated with a Monte Carlo technique including anisotropic scattering and absorption. Thermal heat transport is calculated with a finite difference algorithm. Material properties are specified on a 2-D mesh and can be arbitrary functions of space and time. Arrhenius rate equations are solved for tissue damage caused by elevated temperatures. Optical properties are functions of tissue damage, as determined by previous measurements. Results are presented for the time variation of the light distribution and damage within the tissue as the optical properties of the tissue are altered.

A new computer program, LATIS, being developed at Lawrence Livermore National Laboratory is used to study the effect of pulsed laser irradiation on endovascular patch welding. Various physical and biophysical effects are included in these simulations: laser light scattering and absorption, tissue heating and heat conduction, vascular cooling, and tissue thermal damage. The geometry of a patch being held against the inner vessel wall (500 μm inner diameter) by a balloon is considered. The system is exposed to light pulsed from an optical fiber inside the balloon. A minimum in the depth of damage into the vessel wall is found. The minimum damage zone is about the thickness of the patch material that is heated by the laser. The more ordered the tissue the thinner the minimum zone of damage. The pulse length which minimizes the zone of damage is found to be the time for energy to diffuse across the layer. The delay time between the pulses is determined by the time for the heated layer to cool down. An optimal pulse length exists which minimizes the total time needed to weld the patch to the wall while keeping the thickness of the damaged tissue to less than 100 μm. For the case that is considered, a patch dyed with light absorbing ICG on the side next to the vessel (thickness of the dyed layer is 60 μm), the best protocol is found to be 65-200 ms pulses applied over 2 min.

22470 (VAEC-C–024) **Overexposure measurement on microtron MT-17.** Dang Thanh Luong (Institute of Nuclear Science and Technology, Hanoi (Viet Nam)); Tran Thanh Minh. Viet Nam National Atomic Energy Commission, Ha Noi (Viet Nam). 1995. 10p. Order Number DE95632331. Source: OSTI; NTIS (US Sales Only); INIS.

On 11 November 1992, the Radiation accident happened at the channel of the high energy photon beam generated by stopping 15 MeV accelerated electron on the tungsten target of Microtron MT-17. One physicist has been exposed to the high energy photon beam. The purposes of this work are the determination of overexposure from backscatter and primary beams to estimate the whole body and hand doses received by the victim. It was found that the upper parts of his body may be received the dose from 1.0 Gy to 5.0 Gy per 4 min. of the exposure; the dose received by victim's hands is in interval of 30 - 50 Gy. This report describes environmental work performed at the Device Assembly Facility (DAF) in 1994 by the Basic Environmental Monitoring and Compliance Program (BECAMP). The DAF is located near the Mojave-Great Basin desert transition zone 27 km north of Mercury. The area immediately around the DAF building complex is a gentle slope cut by 1 to 3 m deep arroyos, and occupied by transitional vegetation. In 1994, construction activities were largely limited to work inside the perimeter fence. The DAF was still in a preoperational mode in 1994, and no nuclear materials were present. The DAF facilities were being occupied so there was water in the sewage settling pond, and the roads and lights were in use. Sampling activities in 1994 represent the first year in the proposed monitoring scheme. The proposed biological monitoring plan gives detailed experimental protocols. Plant, lizard, tortoise, small mammal, and bird surveys were performed in 1994. The authors briefly outline procedures employed in 1994. Studies performed on each taxon are reviewed separately then summarized in a concluding section.

22472 (ETDE-DE–115) **Final report on the research project 'Air pollution and forest damage in North-Rhine Westphalia'. Aims, results, conclusions. A balance of nine years of forest damage research in North-Rhine Westphalia.** Koeth-Jahr, I. (Landesanstalt fuer Immissionsschutz des Landes Nordrhein-Westfalen, Essen (Germany)). Ministerium fuer Umwelt, Raumordnung und Landwirtschaft des Landes Nordrhein-Westfalen, Duesseldorf (Germany). Jun 1993. 173p. (In German). Order Number DE95785950. Source: OSTI; NTIS (US Sales Only).

The present report takes stock of nine years of forest damage research in North Rhine - Westphalia. After first relating current hypotheses on the causes of the novel type of forest damage (soil acidification, photooxidants, nitrogen, stress) it deals with the results of field and laboratory studies; the monitoring and recording of forest damage; pollution situation in wooded areas (ozone, sulphur dioxide, nitrogen oxides, air-borne dust, hydrocarbons) and pollutant deposition in spruce and beech; and the soil and climate situation (wind, air humidity, fog, precipitation, temperature, sunshine hours) in different parts of the Land. It then goes on to discuss atmosphere-chemical processes and long-distance transport phenomena (esp. of peroxides and natural terpenes); deposition measurements and soil analyses (protons, ammonia); heavy metal concentrations and toxicity; and, in particular detail, the effects of air pollutants on spruce and beech (foliar loss, mycorrhiza, growth parameters, elemental concentrations in foliage and soil and their change during the period under study). The measurements from the sites of Eggegebirge, Rothaargebirge, and Haardt are compared. The book closes with an inquiry into possibilities of emission abatement and effects of such measures. 22473 (ETDE-DE–117) **Studies at the Wank environmental monitoring base on the xanthophyll cycle as a biomonitor for stress influences of air pollutants and climate in field conditions.** Luetz, C.; Dodell, B.; Kuhnke, R.; Preiser, W. GSF - Forschungszentrum fuer Umwelt und Gesundheit Neuherberg GmbH, Oberschleissheim (Germany). Nov 1994. 91p. (In German). Sponsored by Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany). Order Number DE95785648. Source: OSTI; NTIS (US Sales Only).

Pigments of spruce needles of selected, varyingly damaged trees were studied over a two-year period in two intensive measuring areas of site elevation 910 m and 1575 m, respectively, on Wank. This was the first ever project to study and describe the light and temperature kenetics of the xanthophyll cycle pigments all

year round. It was found that chlorophylls and the family of carotinoids differ in their circannual dynamic behaviour, and that accumulation of these pigments decreases with growing height; individual carotinoids sometimes change their behaviour, e.g., alpha and beta carotin, whose maxima in winter and summer afford the photosynthesis reaction centres protection all year round. Furthermore, kinetic analyses clearly showed that oxidative and photoinhibitory stresses are greater on plateau than on lower sites. Contrary to statements found in the literature, the viola/antheraxanthin ratio is not suited as an early indicator of forest damage. The xanthophyll cycle has proven unsuitable for screening tasks in damage diagnostics in the field. Simulation experiments on young spruce in exposition chambers provided a valuable basis for validating field data. For example, the assumption that ozone counts among the major air pollutants was thus corroborated also for the Wank region. (orig.)

22474 (ETDE-DE–118) **Comparative studies on mycorrhiza and microfungi in the rhizosphere after acid sprinkle irrigation and liming at a spruce stand in 'Hoeglwald'. Final report.** Qian, X.M.; El-Ashkar, A.; Kottke, I.; Oberwinkler, F. Tuebingen Univ. (Germany). Botanisches Inst. [1995]. 89p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0339175E. Order Number DE95785630. Source: OSTI; NTIS (US Sales Only).

A comparative study was made of the fungal microflora populations of the mycorrhizoplane of a 75 to 80-year-old spruce stand and a 140-year-old beech stand in Hoeglwald. The soil of the experimental spruce stand had been subjected to acid sprinkle irrigation or liming from 1984 to 1990. An untreated spruce stand and a neighbouring beech stand served as controls. Eight isolated microfungal species exhibiting pathogenic or antagonistic action were compared with respect to their distribution in the five experimental areas. The species studied were trichoderma viride Pers. ex S.F. Gray. T hamatum (Bon.) Bain, T polysporum (Link ex Pers.) Rifai, cylindrocarpon destructans (Zinsm.) Scholten, sesquicillium candelabrum (Bonorden) Gams, mycelium radicis atrovirens Melin, tolypocladium geodes Grams, oidiodendron majus Barron. Both liming and acid sprinkle irigation disturbed the biological equilibrium of the soil microflora. This mainifested itself in a shift in interspecific dominance. For example, the area subjected to acid sprinkle irrigation showed proliferation of mycelium radicis atrovirens and oidiodendron majus, sterile mycelia and yeast plants, and a decline in the distribution of trichoderma species, whereas sesquicillium candelabrum and cylindrocarpon were found to porliferate in the lined area. A side from the altered soil conditions due to the treatment, the change in dominance relationships is attributed above all to direct interactions between fungal species. (orig.)

22475 (ETDE-DE–119) **Capacity for oxidative and reductive detoxification of NO_x and SO_2 and for neutralisation of acid in leaves and needles of forest trees. Final report.** Heber, U. (Wuerzburg Univ. (Germany). Julius-von-Sachs-Institut fuer Biowissenschaften mit Botanischem Garten); Slovik, S. Wuerzburg Univ. (Germany). Julius-von-Sachs-Institut fuer Biowissenschaften mit Botanischem Garten; Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU). Nov 1994. 214p. (In German). Order Number DE95785628. Source: OSTI; NTIS (US Sales Only).

This final report presents analysis data of all the mineral substances found in samples of timber, bark, foliage, and leaf litter from healthy individuals of 17 tree species. These data permit calculating organic anion concentrations as well as the amount of protons produced endogenously during organ growth and subsequently neutralised metabolically in healthy trees. This later quantity is important for estimating the relative proton load resulting from stomatal uptake of trace gases, in particular potentially acid air pollutants. The paper reports on very detailed studies on substances found, endogenous proton production during organ growth, and differential organ growth rates in picea abies at different sites. Chemical analyses in needles needle litter, wood and bark of root and stem, respectively, and the individual growth rates of these organs permit calculating, firstly, the entire yearly nutrient requirements in organic sulphur and nitrogen compounds broken down by silvicultural yield class (WIEDEMANN Tables), thinning scenarios, stand age, and mean needle age; and secondly, the most important ecosystemic nutrient circulation rates for all major plants nutrients. Furthermore, the system of wood-physiological pH-stat-mechanisms in the spruce corm and the yearly proton extrusion rate into the soil for NO_3^- and NH_4^+ phytotrophy in spruce were quantified. Finally, yearly stomatal trace gas, specifically SO_2, No_x, and O_3, uptake in native spruce crowns were quantified as a function of mean annual air pollutant levels and length of vegetation period. (orig.)

22476 (ETDE-DE–121) **Comparative protein microanalysis in the partners of a mycorrhizal symbiosis after acid sprinkle irrigation and liming at a spruce stand in 'Hoeglwald'. Final report.** Guttenberger, M.; Zick, H.; Hampp, R. Tuebingen Univ. (Germany). Botanisches Inst. [1994]. 58p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0339175K. Order Number DE95785667. Source: OSTI; NTIS (US Sales Only).

A study was performed on a dominant species (piceirhiza nigra) inhabiting the areas subjected to liming in the Hoeglwald project. The results were as follows. Activity of the glucose-6-phosphate-dehydrogenase enzyme was lower in mycorrhiza in areas subjected to liming and acid sprinkle irrigation than in areas subjected to liming only. As the newly developed method of quantitative enzyme electrophoresis (electrophoretic separation of the enzymes of the two symbiotic partners, densitometric evaluation) showed, this effect was largely due to a lower activity on the part of the fungus. Since other enzymes were not affected, this seems to have been a regulative process. The fungal partner accounted for the greater part of glucose-6-phosphate-dehydrogenase activity of the mycorrhiza regardless of the kind of treatment. During the two vegetation periods covered, fluctuations in specific enzyme activity were low in both areas. The results show that the treatment had induced changes in soil conditions which had a physiologically relevant impact on mycorrhizal metabolism (primarily that of the fungus). A direct impact, e.g., through the direct action of water or acid can be excluded as the examinations weren't started until after the termination of sprinkle irrigation. (orig.)

22477 (ETDE-DE–122) **Examination of activity along secondary metabolic pathways in spruce and pine as possible indicators of damage symptoms in the elevation profile of Wank. Final report.** Heller, W.; Rosemann, D.; Sandermann, H. Jr.; Henn, A.; Steinke, S.; Klotz, R. GSF - Forschungszentrum fuer Umwelt und Gesundheit Neuherberg GmbH, Oberschleissheim (Germany). Inst. fuer Biochemische Pflanzenpathologie. 30 Sep 1994. 114p. (In German). Sponsored by Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany). Project Number PBWU 6495-1053-77291. Order Number DE95785649. Source: OSTI; NTIS (US Sales Only).

Methanol-solable as well as cell-wall-bound secondary metabolites in spruce, pine, and dwarf pine growing on Wank were found to differ in dependence of site elevation. All-year monitoring of various metabolites showed that trees of elevation zone IV differ markedly from trees of zones I and VII. As yet it has not been possible to establish a relationship between these compounds as possible biomarkes and the damage stage of the trees sampled. In the case of dwarf pine, the metabolites analysed vary in concentration in dependence of UV-B radiant intensity. These acylated flavonol derivates occur exclusively in the epidermis where they serve as an effective shield against the incident UV radiation. Measurements were performed in controlled experiments on spruce, pine, and dwarf pine kept in exposure chambers. The plants were exposed to a climate typical of Wank save for the experimental variables of ozone concentration, which was kept either at ambient or double the ambient level, and UV-B radiation, which was administered in very high and very low doses. It was found that the 4-coumaric acid-acylated flavonol glycosides are induced by UV-B radiation and that ozone inhibits this induction. Model studies on interactions between heterobasidion annosum and ozone in pine seedlings once with and once without a mycorrhiza partner showed that mycorrhiza are largely capable of protecting the plant and that a pathogen attack on its roots render the plant very sensitive to ozone. (orig.)

22478 (ETDE-DE–129) **Influence of gaseous pollutants on the biosynthesis of plant cuticles and their impact on transport properties. Final report.** Lendzian, K.J. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU). Jun 1992. 25p. (In German). Sponsored by Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany). Order Number DE95780182. Source: OSTI; NTIS (US Sales Only).

The second part of the research project yielded the following results: 1. Exposing oak, beech, ivy and fir plants to a base load and temporarily increased load of the vapour phase pollutants ozone, SO_2 and NO_2 does not result in a change of the mass saturation of the leaf cuticles. Cuticles do not become thicker or thinner; the amount of cutin and wax is not changed by fumigation. 2. The biosynthesis of the cuticle components wax and cutin is not affected by long-term fumigation with gaseous pollutants. The turnover of substrates within the biosynthesis chain is not altered. 3. Also in the case of simultaneous fumigation and measurement of biosynthesis performance in leaves no differences between the controls and treated plants are noted. 4. The biosynthesis performance of leaves with a view to the building up cuticles is not impaired by the gaseous pollutants ozone, SO_2 and NO_2. Nor do these gaseous pollutants, even in combination, alter the transport properties of cuticles. 5. SO_2 sorption by cuticles of Abies alba was more closely characterized. In the case of environmentally relevant concentrations, dry deposition may well result in a partition coefficient of around 10^6. But it takes more than seven days till sorption reaches steady-state. (orig./UWA)

22479 (ETDE-DE–130) **Ozone effects on plants. Evaluation of ozone profiles measured in Hessen.** Umweltplanung, Arbeits- und Umweltschutz. Schriftenreihe der Hessischen Landesanstalt fuer Umwelt, v. 143. Gruenhage, L.; Herm, K.; Hanewald, K.; Jaeger, H.J. Hessische Landesanstalt fuer Umwelt, Wiesbaden (Germany); Giessen Univ. (Germany). Inst. fuer Pflanzenoekologie. 1992. 80p. (In German). Order Number DE95780160. Source: OSTI; NTIS (US Sales Only).

The study had the aim to evaluate ozone measuring data from selected air pollution measuring stations in Hessen with a view to possible hazards to the vegetation. A model which describes not only O_3 concentrations in the ambient air but takes also the exchange properties of the atmosphere and sink properties of plants into account and whose key parameter is related to O_3-induced disease symptoms in plants in an unequivocal manner could be evolved for Nicotiana tabacum. The following data for making use of this model can be provided by federal and laender air hygiene measuring stations: O_3 concentration in the ambient air, air temperature, air humidity, horizontal wind speed, global radiation. Assessing the O_3 exposure of the vegetation using the new parameters RISK(1) and RISK(2) leads to a more precise result in ecological terms than employing the quantities commonly used. - The calculation of risk parameters for different farm crops relies on exposure-and-effect functions mentioned in literature. According to these, only barley and maize are to be considered as O_3-tolerant. For all other crops great differences in tolerance from one species to another and between the different years are reported. The substantial potential drop in summer wheat yield is particularly striking. Previous investigations have not taken into account a possible compensation of lower yield through ozone by the increase of the CO_2 concentration from approximately 290 ppm to, currently, about 360 ppm: where the CO_2 fertilization effect and potential O_3-induced yield loss are simultaneously considered the two cancel each other out due, probably, to an additive combination effect. Accordingly, prognostications for higher yields because of the increase of the CO_2 concentration are incorrect where O_3 sensitive crops are concerned. (orig./UWA)

22480 (GSF–39/93, pp. 255-264) **Results of sulphur and nitrogen measurements in samples of the Austrian bio-indicator network.** Stefan, K. (Forstliche Bundesversuchsanstalt, Wien (Austria)). GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU). Nov 1993. 578p. (In German). Sponsored by Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany). (CONF-9304291–: International symposium on the carry-over of pollutants from the atmosphere and on forest soil pollution in the ARGE ALP and ALPEN-ADRIA countries, Berchtesgaden (Germany), 27-29 Apr 1993). In *Carry-over of pollutants from the atmosphere and on forest soil pollution in the ARGE ALP and ALPEN-ADRIA countries. Proceedings.* Order Number DE95778131. Source: OSTI; NTIS (US Sales Only).

Results of chemical needle analyses of the Austrian bioindicator network show that on a nationwide scale the importance of SO2 in forest-damaging air pollution has not decreased; within 10 years of monitoring there have, however, been some shifts of areas that show the effects of sulphur immissions just as there have also been some local or regional improvements. With increasing sea level there were fewer instances where maximum values were exceeded but increasing areas which received the overall classification 1 that is to say results of chemical needle analyses did not point to immission effects of S. A considerable part of the areas with S-immission effects are assumed to be victims of transborder immissions. A negative influence of N-carry-over on the nutrient element balance can only be assumed for certain local sites. Where N-supply is concerned (which over all the years where main nutrient were studied showed the largest deficiency) there is a strong regional differentiation and therefore - as the results of the S/N ratio indicates - also different effects of sulphur immissions. (orig./EW).

22481 (GSF–39/93, pp. 284-293) **Atmospheric carry-over of N and absorption of N in spruce stands of Northern Bavaria.** Bruckner, G. (Lehrstuhl fuer Pflanzenoekologie, Univ. Bayreuth (Germany)); Schulze, E.D.; Gebauer, G. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU). Nov 1993. 578p. (In German). Tests with ^{15}N marked nitrogen compounds showed that surface absorption in spruces plays an decisive role in the induction of nutrient imbalances in spruce ecosystems. Absorption of NH_4^+ and NO_3^- by surface plant organs is assumed to account for one third of the demand and is therefore an important parameter in the N-household of forest trees. Absorption of NO_x and NH_3 depends on wind velocities, air humidity and the additional occurrence of other noxious gases. Age, nitrogen nutrition of plants and stomatary conductivity also influence absorption. Concentration being the same NH_3 is absorbed at a far higher rate than NO_x and therefore has the same importance for the nitrogen balance of forest trees as NO_x even though NH_3 concentrations in the Fichtelgebirge are far lower than NO_x concentrations. In order to reduce nitrogen-induced forest damage and reduce nitrogen emissions it is necessary to impose restrictions not only on road traffic and industry but also on agriculture. (orig./EW).

22482 (GSF–39/93, pp. 311-319) **Changes in growth of spruce stands in Southern Bavaria.** Roehle, H. (Lehrstuhl fuer Waldwachstumskunde, Univ. Muenchen (Germany)). GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU). Nov 1993. 578p. (In German). Sponsored by Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany). (CONF-9304291–: International symposium on the carry-over of pollutants from the atmosphere and on forest soil pollution in the ARGE ALP and ALPEN-ADRIA countries, Berchtesgaden (Germany), 27-29 Apr 1993). In *Carry-over of pollutants from the atmosphere and on forest soil pollution in the ARGE ALP and ALPEN-ADRIA countries. Proceedings.* Order Number DE95778131. Source: OSTI; NTIS (US Sales Only).

The essential results of the growth studies carried out in Southern Bavarian spruce stands are: 1. Damaged spruce stands show regionally differentiated relations between growth and vitality; this allows derive assessment function for the determination of pollutant-induced lack of growth. 2. In non-damaged spruce stands growth over the last 100 years can be subdivided into two phases of contradictory behaviour: a first phase conform to models where growth rates, after exceeding culmination slowed dowed with age, this phase lasted from the end of the 19th centruy until the 1950s of this century. A subsequent phase where growth rates remain steady or even increase with increasing age, this is contradictory to scientific opinion. In this phase there is a growth development which is clearly different from model curves both in terms of direction and in terms of levels. (orig./EW).

22483 (GSF–39/93, pp. 344-351) **Nitrogen carry-over in mountaineous peatland.** Pohl, W. (Limnologische Station des Inst. fuer Botanik und Mikrobiologie, TU Muenchen (Germany)); Melzer, A. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU). Nov 1993. 578p. (In German). A comprehensive study, conducted in 1990 and 1991 looked into the effects of nitrogen carry-over on the nitrogen metabolism in sphagnum growing on peat in the field. The area concerned is called Loisachfilze and located 9 km north of Kochel. Different concentrations of ammonia and nitrate were applied to selected test areas. In order to quantify the reaction of sphagnacea on this fertilisation enzyme activity of nitratreductase (NR) which catalyses the first step in nitrate assimilation, was measured. At the same time the nitrogen content of peat moss and peat water was measured. The N-metabolism of peat moss was also measured all over Bavaria. Enzyme activity turned out to be difficult as a biotest for establishing the present state of peat areas in higher altitudes. Several months of nitrogen fertilisation caused NR inhibition in sphagnum cuspidyatum and S. magellanicum. Nitrate reductase inhibition at high NO_3 concentrations (25kg/ha/year) was stronger in 1990 than in 1991 where nitrate addition was (only 16.6kg/ha/annum) Ammonia too caused an inhibition of nitrate reductase activity. Analysis of moor water from the Loisachfilze showed clearly increased nitrate concentrations on the area fertilised with this nutrient. Once phagnacea can no longer sufficiently retain the nitrate from increasing air pollution it can penetrate into the root section of higher plants. In this case nitrophilic plants would very likely start to propagate. They may replace sphagnum and change the typical vegetation of high-altitude peat areas. (orig./EW)

Two studies on the state of the trees in the state forest in Lombardy were conducted in 1990 and 1992. Random sampling included 1620 plants distributed over a grid of 2 by 2 km in 60 areas selected for the study. Thinned canopies, discolouring and leaf curl (in decidous trees) are the most evident signs of damage. Results also show significant increas of forest damage with causes yet unknown. Total damage including plants with slight damage shows that in 1992 67% of the plants were affected, 40% show mean to strong damage. Compared to 1990 the state of the forest has definitely worsened considerably. Especially the Alps and the pre-Alpine regions are badly affected. A clear link has been established between damage intensity and some biotop parameters (quality, location). The influence of conventional causes (insects, fungi) seem to be limited. (orig./EW)

The studies conducted for over a year with spruces in the Kalkalpen in higher altitudes of the Wank (Bavarian Kalkalpen, 1575 m nn) show that the dynamics of needle fall of green needles which come up to 522 kg/ha (TS) and account for 29% of the total needle loss correlate with frost peroids in winter and with ozone pollution in the summer. A critical boundary for the triggering of green needle drop was found if ozone concentrations above 60 ppb persist for longer than 10 hours per day (summer) or if there a relative air humidity of 60% for more than 8 hours per day is not reached (winter). The results from the summer season are seen as an indicator for needle loss caused by ozone. Participation of other factors which occur simultaneously with high ozon concentrations such as low air humidity and increased UV-radiation cannot be excluded. Winter losses of green needles are probably connected with dryness during frost periods. (orig./EW)

In this paper the preliminary results of a study conducted by the "Istituto di Fisica Generale Applicata", Mailand University on the determination of natural elements and pollutant elements in bioindicators is described. The technology used for analysis is energy dispersive X-ray flueorescence (EDXRF). Areas selected are: Alpine regions, Valmalenco and lower-Valtellina and urbanised areas like the hinterland of Milano and the area around Como. (orig./EW)

22491 (NEI-DK–2043) **A study of literature references on the combined effects of ozone and nitrogen dioxide.** Gehl, J. Center for Alternativ Samfundsanalyse (CASA), Copenhagen (Denmark). Jan 1995. 54p. (In Danish). Order Number DE95787792. Source: OSTI; NTIS.

A review of experimental evidence of combined effects of nitrogen dioxide (NO_2) and ozone (O_3) and of epidemiological surveys performed at levels comparable to, or below, the levels found in Copenhagen (Denmark). Short- and long-term effects were studied. Synergistic effects between O_3 and NO_2 were found with concentrations of 0.3 to 0.8 ppm O_3 and 0.3 to 14.4 ppm NO_2. Synergistic effects have been found on: Increased presence of proteins in lung lavage fluid, of inflammatory cells and epithelial cells in lung lavage fluid, increased cell division in alveoles and especially bronchioles, oxidative damages in guinea pigs and increased production of antioxidants in rats, increased activity of some enzyme systems of cell metabolism and detoxification and increased production of some prostaglandins (PgE2 and PgF2alfa). Antagonistic effects have been found on production of some prostaglandins (tromboxan A2 and PgI), and on certain cellular detoxification systems (p-450 and associated systems). An effects has been found on functions of the immune system. Epidemiological surveys showed increased morbidity due to asthma, chronic bronchitis and emphysema associated with exposure to sulphur dioxide, nitrogen dioxide and ozone. High exposure to traffic-related air pollution causes headache, dizziness, irritation of mucus membranes as well as asthma and chronic bronchitis. Increased incidence and growth of cancers is shown in animals exposed to combinations of O_3 and NO_2. The incidence of cancer especially lung cancer, is increased in Copenhagen. The increased incidence of lung cancer could not be attributed to tobacco smoking alone. The dose rate is important for the health effects of both O_3, NO_2 and a mixture of the two. Epidemilogical evidence reveals the importance of short term peaks. (AB) 44 refs.

22492 (UBA-FB–93-066) **Comparative analysis and evaluation of liver foci bioassays and their efficiency as short term screening test systems for detection of carcinogenic effects of suggested carcinogens. Final report.** Oesterle, D.; Deml, E.; Greim, H. GSF - Forschungszentrum fuer Umwelt und Gesundheit Neuherberg GmbH, Oberschleissheim (Germany). Inst. fuer Toxikologie. Jan 1992. 36p. (In German). Sponsored by Umweltbundesamt, Berlin (Germany). Contract UFOPLAN 10603059; Contract GSF-FE–77666. Order Number DE95785973. Source: OSTI; NTIS (US Sales Only).

Three rat liver foci bioassays (A, B, C), proposed for routine testing of suggested carcinogens, have been compared with respect to their efficiency as short term screening test systems. The objective was to select the most suitable assay in view of a reliable detection of initiating and promoting agents, sensitivity, expenditure of work and animals' welfare. The evaluation of dose-response relationships, measured as number and area of enzyme-deficient foci dependent on the dose, revealed that the initiation-promotion schedule using 3 weeks old female rats was most sensitive (A). Six weeks old rats and PH at the beginning followed by promotion (B) or selection (C) were less sensitive. Protocol (C) was least sensitive and impaired animals welfare strongly. The comparison included 6 initiating and 4 promoting agents. It exhibited that the most simple system (A) was most sensitive and least impairing animals' welfare. (orig.)

22493 (UCRL-JC–120215) **Plasma mediated ablation of biological tissues with ultrashort laser pulses.** Oraevsky, A.A. (Lawrence Livermore National Lab., CA (United States)); DaSilva, L.B.; Feit, M.D. Lawrence Livermore National Lab., CA (United States). 8 Mar 1995. 10p. Sponsored by USDOE, Washington, DC (United States);Whitaker Foundation (United States). DOE Contract W-7405-ENG-48. (CONF-950226–39: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-14 Feb 1995). Order Number DE95011748. Source: OSTI; NTIS; GPO Dep.

Plasma mediated ablation of collagen gels and porcine cornea was studied at various laser pulse durations in the range from 350 fs to 1 ns at 1,053 nm wavelength. A time resolved stress detection technique was employed to measure transient stress profiles and amplitudes. Optical microscopy was used to characterize ablation craters qualitatively, while a wide band acoustic transducer helped to quantify tissue mechanical response and the ablation threshold. The ablation threshold was measured as a function of

laser pulse duration and linear absorption coefficient. For nanosecond pulses the ablation threshold was found to have a strong dependence on the linear absorption coefficient of the material. As the pulse length decreased into the subpicosecond regime the ablation threshold became insensitive to the linear absorption coefficient. The ablation efficiency was found to be insensitive to both the laser pulse duration and the linear absorption coefficient. High quality ablation craters with no thermal or mechanical damage to surrounding material were obtained with 350 fs laser pulses. The mechanism of optical breakdown at the tissue surface was theoretically investigated. In the nanosecond regime, optical breakdown proceeds as an electron collisional avalanche ionization initiated by thermal seed electrons. These seed electrons are created by heating of the tissue by linear absorption. In the ultrashort pulse range, optical breakdown is initiated by the multiphoton ionization of the irradiated medium (6 photons in case of tissue irradiated at 1,053 nm wavelength), and becomes less sensitive to the linear absorption coefficient. The energy deposition profile is insensitive to both the laser pulse duration and the linear absorption coefficient.

Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95011834. Source: OSTI; NTIS; GPO Dep.

The Department of Energy's (DOE) non-nuclear facilities generally require only a qualitative accident analysis to assess facility risks in accordance with DOE Order 5481.1B, Safety Analysis and Review System. Achieving a meaningful qualitative assessment of risk necessarily requires the use of suitable non-numerical assessment criteria. Typically, the methods and criteria for assigning facility-specific accident scenarios to the qualitative severity and likelihood classification system in the DOE order requires significant judgment in many applications. Systematic methods for more consistently assigning the total accident scenario frequency and associated consequences are required to substantiate and enhance future risk ranking between various activities at Sandia National Laboratories (SNL). SNL's Risk Management and National Environmental Policy Act (NEPA) Department has developed an improved methodology for performing qualitative risk assessments in accordance wi the DOE order requirements. Products of this effort are an improved set of qualitative description that permit (1) definition of the severity for both technical and programmatic consequences that may result from a variety of accident scenarios, and (2) qualitative representation of the likelihood of occurrence. These sets of descriptions are intended to facilitate proper application of DOE criteria for assessing facility risks.

22496 (UCRL-JC–120472) **Ergonomics problems and solutions in biotechnology laboratories.** Coward, T.W.; Stengel, J.W.; Fellingham-Gilbert, P. Lawrence Livermore National Lab., CA (United States). Mar 1995. 6p. DOE Contract W-7405-ENG-48. (CONF-9505214–1: Silicon Valley ergonomics conference, San Jose, CA (United States), 21-22 May 1995). Order Number DE95012221. Source: OSTI; NTIS; GPO Dep.

The multi-functional successful ergonomics program currently implemented at Lawrence Livermore National Laboratory (LLNL) will be presented with special emphasis on recent findings in the Biotechnology laboratory environment. In addition to a discussion of more traditional computer-related repetitive stress injuries and associated statistics, the presentation will cover identification of ergonomic problems in laboratory functions such as pipetting, radiation shielding, and microscope work. Techniques to alleviate symptoms and prevent future injuries will be presented.

(Argonne National Lab., IL (United States)); Thompson, M.D.; Kuecher, G.J.; Wilkey, P.L.; Isaacson, H.R. Argonne National Lab., IL (United States); Gas Research Inst., Chicago, IL (United States). [1995]. 12p. Sponsored by Gas Research Inst., Chicago, IL (United States). DOE Contract W-31-109-ENG-38. (CONF-950450–9: 8. annual symposium on the application of geophysics to environmental and engineering problems, Orlando, FL (United States), 23-27 Apr 1995). Order Number DE95012284. Source: OSTI; NTIS; GPO Dep.

A conceptual hydrodynamic model in the Holocene and upper Pleistocene beneath the Louisiana wetlands is described in terms of safety distributions. Porewater safety is calculated from electrical measurements, including resistivity soundings, electric logs, and electromagnetic profiling. Electrical measurements support the primary, basin-wide groundwater flow model; however, the data also indicate secondary contributions from expulsion of fluids under geopressure along active growth faults and from original waters of deposition. Expulsion of water from growth faults has been described previously for deeper sections of the Pleistocene, but has not been reported for the Holocene or upper Pleistocene beneath the Louisiana wetlands. Porewater chemistry variations beneath the coastal wetlands are a consequence of the following (in order of importance): (1) environment of deposition; (2) a basin-wide, regional flow system; (3) expulsion from deep-seated growth faults; and (4) pore water extrusion due to compaction. Water chemistry in Holocene clays and muds is influenced primarily by the deposition environment In Pleistocene sands, the chemistry is a function of the other three factors.

22498 (BNL–61504) **A probabilistic model to liquefaction assessment of dams.** Simos, N.; Costantino, C.J.; Reich, M. Brookhaven National Lab., Upton, NY (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950740–44: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95008867. Source: OSTI; NTIS; GPO Dep.

In an effort to evaluate earthquake liquefaction potential of soil media, several statistical models ranging from purely empirical to mathematically sophisticated have been devised. While deterministic methods define susceptibility of a soil structure to liquefaction, for a given seismic event, in the sense that the site does or does not liquefy, probabilistic approaches incorporate statistical properties associated with both the earthquake and site characterization. In this study a stochastic model is formulated to assess liquefaction potential of soil structures in general and earth dams in particular induced by earthquakes. Such earthquakes are realizations of a random process expressed in the form of a power spectral density. Uncertainties in the soil resistance to liquefaction are also introduced with probability density functions around in-situ measurements of parameters associated with the soil strength. The attempt of this study is to devise a procedure that will lead to a continuous probability of liquefaction at a given site. Monte Carlo simulations

are employed for the probabilistic model. In addition a stochastic model is presented. The dynamic response of the two-phase medium is obtained with the help of the POROSLAM code and it is expressed in the form of a transfer function (Unit Response).

22499 (BNL-NUREG–61664) **Convolution-deconvolution in DIGES.** Philippacopoulos, A.J. (Brookhaven National Lab., Upton, NY (United States). Dept. of Advanced Technology); Simos, N. Brookhaven National Lab., Upton, NY (United States). [1995]. 9p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950740–43: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Source: OSTI; NTIS; INIS; GPO.

Convolution and deconvolution operations is by all means a very important aspect of SSI analysis since it influences the input to the seismic analysis. This paper documents some of the convolution/deconvolution procedures which have been implemented into the DIGES code. The 1-D propagation of shear and dilatational waves in typical layered configurations involving a stack of layers overlying a rock is treated by DIGES in a similar fashion to that of available codes, e.g. CARES, SHAKE. For certain configurations, however, there is no need to perform such analyses since the corresponding solutions can be obtained in analytic form. Typical cases involve deposits which can be modeled by a uniform halfspace or simple layered halfspaces. For such cases DIGES uses closed-form solutions. These solutions are given for one as well as two dimensional deconvolution. The type of waves considered include P, SV and SH waves. The non-vertical incidence is given special attention since deconvolution can be defined differently depending on the problem of interest. For all wave cases considered, corresponding transfer functions are presented in closed-form. Transient solutions are obtained in the frequency domain. Finally, a variety of forms are considered for representing the free field motion both in terms of deterministic as well as probabilistic representations. These include (a) acceleration time histories, (b) response spectra (c) Fourier spectra and (d) cross-spectral densities.

22500 (CONF-9310433–Absts.) **Cloud-radiation interactions and their parameterization in climate models.** National Oceanic and Atmospheric Administration, Camp Springs, MD (United States). Science Center. Nov 1994. 147p. Sponsored by USDOE, Washington, DC (United States);National Oceanic and Atmospheric Administration, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AI02-93ER61551. From Cloud-radiation interactions and their parameterization in climate models; Camp Springs, MD (United States); 18-20 Oct 1993. Order Number DE95011484. Source: OSTI; NTIS; GPO Dep.

This report contains papers from the International Workshop on Cloud-Radiation Interactions and Their Parameterization in Climate Models met on 18–20 October 1993 in Camp Springs, Maryland, USA. It was organized by the Joint Working Group on Clouds and Radiation of the International Association of Meteorology and Atmospheric Sciences. Recommendations were grouped into three broad areas: (1) general circulation models (GCMs), (2) satellite studies, and (3) process studies. Each of the panels developed recommendations on the. themes of the workshop. Explicitly or implicitly, each panel independently recommended observations of basic cloud microphysical properties (water content, phase, size) on the scales resolved by GCMs. Such observations are necessary to validate cloud parameterizations in GCMs, to use satellite data to infer radiative forcing in the atmosphere and at the earth's surface, and to refine the process models which are used to develop advanced cloud parameterizations.

22501 (DOE/ET/53088–669) **Nonlinear symmetric stability of planetary atmospheres.** Bowman, J.C. (Texas Univ., Austin, TX (United States). Inst. for Fusion Studies); Shepherd, T.G. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Nov 1994. 32p. Sponsored by USDOE, Washington, DC (United States);Natural Sciences and Engineering Research Council of Canada, Ottawa, ON (Canada);Atmospheric Environment Service, Montreal, PQ (Canada). DOE Contract FG05-80ET53088. (IFSR–669). Order Number DE95012133. Source: OSTI; NTIS; GPO Dep.

The energy-Casimir method is applied to the problem of symmetric stability in the context of a compressible, hydrostatic planetary atmosphere with a general equation of state. Linear stability criteria for symmetric disturbances to a zonally symmetric baroclinic flow are obtained. In the special case of a perfect gas the results of Stevens (1983) are recovered. Nonlinear stability conditions are also obtained that, in addition to implying linear stability, provide an upper bound on a certain positive-definite measure of disturbance amplitude.

22502 (ES/CNPE–2) **Earthquake risk reduction in the United States: An assessment of selected user needs and recommendations for the National Earthquake Hazards Reduction Program.** Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States). Center for Natural Phenomena Engineering. 31 Dec 1994. 315p. Sponsored by USDOE, Washington, DC (United States);Federal Emergency Management Agency, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95011542. Source: OSTI; NTIS; GPO Dep.

This Assessment was conducted to improve the National Earthquake Hazards Reduction Program (NEHRP) by providing NEHRP agencies with information that supports their user-oriented setting of crosscutting priorities in the NEHRP strategic planning process. The primary objective of this Assessment was to take a "snapshot" evaluation of the needs of selected users throughout the major program elements of NEHRP. Secondary objectives were to conduct an assessment of the knowledge that exists (or is being developed by NEHRP) to support earthquake risk reduction, and to begin a process of evaluating how NEHRP is meeting user needs. An identification of NEHRP's strengths also resulted from the effort, since those strengths demonstrate successful methods that may be useful to NEHRP in the future. These strengths are identified in the text, and many of them represent important achievements since the Earthquake Hazards Reduction Act was passed in 1977.

22503 (LA-SUB–95-56) **An integrated observational, experimental and computational study of plume-ridge interaction.** Gable, C.; Kincaid, C. Los Alamos National Lab., NM (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95012954. Source: OSTI; NTIS; GPO Dep.

The existence of sub-horizontal channels connecting hotspot plumes and spreading ridges has been suggested by recent observationally based studies. These features have important consequences for understanding mantle dynamics and the manner in which the mantle interacts both thermally and chemically with Earth's surface. A striking result has been the importance of a sloping rheological boundary layer, resulting from the combination of variable fluid viscosity and plate spreading, in modulating channel development and evolution. Comparison of results in 2D and 3D experiments clearly indicate the limitations of 2D representations of flows which include both small scale plumes within a larger scale shear flow. 2D experiments investigate higher order physical effects such as thermochemical plumes and relative motion between plume source and ridge axis. These effects are best studied first in the more simplified 2D geometry. Experiments completed to date have significantly increased our understanding of the process of communication between plumes and ridges. This initial stage of funded research has also lead to increased interaction between observation and theory. As an example of this, Kincaid was invited to participate in a data collection cruise to Easter Island-EPR system designed to study plume-ridge interaction.

22504 (LA-UR–95-887) **Structure of the Espanola Basin, Rio Grande Rift, New Mexico, from SAGE seismic and gravity data.** Ferguson, J.F. (Univ. of Texas, Richardson, TX (United States)); Baldridge, W.S.; Braile, L.W.; Biehler, S.; Gilpin, B. Los Alamos National Lab., NM (United States). [1995]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9509119–1: 1995 New Mexico Geological Society fall field conference, Santa Fe, NM (United States), 25-29 Sep 1995). Order Number DE95009428. Source: OSTI; NTIS; GPO Dep.

Seismic and gravity data, acquired by the SAGE program over the past twelve years, are used to define the geometry of the Espanola basin and the extent of pre-Tertiary sedimentary rocks. The

Paleozoic and Mesozoic units have been thinned and removed during Laramide uplift in an area now obscured by the younger rift basin. The Espanola basin is generally a shallow, asymmetric transitional structure between deeper, better developed basins to the northeast and southwest. The gravity data indicate the presence of three narrow, but deep, structural lows arrayed along the Embudo/Pajarito fault system. These sub-basins seem to be younger than the faults on the basin margins. This apparent focussing of deformation in the later history of the basin may be a response to changes in regional stress or more local accommodation of the rift extension. Future work is planned to develop seismic data over one of these sub-basins, the Velarde graben, and to better define the gravity map in order to facilitate three-dimensional modeling.

22505 (ORNL/CDIAC–66) **Six- and three-hourly meteorological observations from 223 USSR stations.** Razuvaev, V.N. (All-Russian Research Inst. of Hydrometeorologicl Information, Obninsk (Russia). World Data Centre); Apasova, E.B.; Martuganov, R.A.; Kaiser, D.P. Oak Ridge National Lab., TN (United States). Apr 1995. 123p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (NDP–048). Order Number DE95012942. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes a database containing 6- and 3-hourly meteorological observations from a 223-station network of the former Soviet Union. These data have been made available through cooperation between the two principal climate data centers of the United States and Russia: the National Climatic Data Center (NCDC), in Asheville, North Carolina, and the All-Russian Research Institute of Hydrometeorological Information – World Data Centre (RIHMI-WDC) in Obninsk. Station records consist of 6- and 3-hourly observations of some 24 meteorological variables including temperature, weather type, precipitation amount, cloud amount and type, sea level pressure, relative humidity, and wind direction and speed. The 6-hourly observations extend from 1936 to 1965; the 3-hourly observations extend from 1966 through the mid-1980s (1983, 1984, 1985, or 1986; depending on the station). These data have undergone extensive quality assurance checks by RIHMI-WDC, NCDC, and the Carbon Dioxide Information Analysis Center (CDIAC). The database represents a wealth of meteorological information for a large and climatologically important portion of the earth's land area, and should prove extremely useful for a wide variety of regional climate change studies. These data are available free of charge as a numeric data package (NDP) from CDIAC. The NDP consists of this document and 40 data files that are available via the Internet or on 8mm tape. The total size of the database is ~2.6 gigabytes.

22506 (UCRL-JC–120952) **Can T phases be used to map blockage?.** Harris, D.; Hauk, T. Lawrence Livermore National Lab., CA (United States). May 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9505222–1: 1995 monitoring technologies conference, Chantilly, VA (United States), 15-18 May 1995). Order Number DE95013309. Source: OSTI; NTIS; GPO Dep.

The placement of stations in a CTBT hydroacoustic monitoring network is controlled, in large part, by the presence of bathymetric features or land masses that block propagation. In the absence of blocking features, propagation is very efficient in the SOFAR channel, allowing surveillance over large basins with hydrophone networks that are sparse compared to seismic networks. Blockage can be estimated from theoretical calculations of acoustic attenuation. While calibration of attenuation with controlled sources is best, it is also prohibitively expensive. The T phases generated by undersea earthquakes are known to be sensitive to interruptions of the SOFAR channel. Earthquakes along ridges may illuminate regions of interest to define blockage areas. Our initial examination of T phase amplitudes suggests that T phases can be used to map blockage or other strong path attenuation. The principal difficulty to be surmounted is the ambiguity between source coupling and path attenuation. We are attempting to quantify coupling with a probabilistic model, which would permit us to estimate attenuation and to quantify the reliability of the estimate.

22507 (IC–95/70) **On the Tannaka-Artin problem.** Mahdavi Hezavehi, M. International Centre for Theoretical Physics, Trieste (Italy). May 1995. 6p. Order Number DE95633900. Source: OSTI; NTIS (US Sales Only); INIS.

Let D be a division ring of index n over its centre F. Denote by RN(D*) and N(D*) the images of D* = D - {0} under the reduced norm functions of D to F, respectively. Algebraic properties of the Abelian factor group G(D) := D*/RN(D*)D', where D' is the derived group of D*, are investigated. It is shown that there is a group homomorphism ϕ : G(D) → H(D), where H(D) := RN(D*)/N(D*), whose kernel is a homormophic image of the reduced Whitehead group $SK_1(D)$. Using this result, it is proved that $SK_1(D) = \{1\}$ if and only if $\Omega = Z(D')$ and ϕ is an isomorphism, where Ω is the subgroup of the existing n-th roots of unity in F and Z(D') is the centre of the derived group of D*. (author). 8 refs.

22508 (IC–95/71) **On a question of Herstein concerning commutators in division rings.** Mahdavi Hezavehi, M. (International Centre for Theoretical Physics, Trieste (Italy)); Akbari Feyzaabaadi, S. International Centre for Theoretical Physics, Trieste (Italy). May 1995. 4p. Order Number DE95633901. Source: OSTI; NTIS (US Sales Only); INIS.

Let D be a division ring with centre Z in which for all x not = 0 and y not = 0 in D, $(xyx^{-1}y^{-1})^{p(x,y)}$ is an element of Z, for some integer $p(x,y) \geq 1$, depending on x and y. Given a is an element of D such that a^s is an element of Z for some $s \geq 1$, it is shown that the minimal polynomial of a over Z is of the form $t^k - r$, where (k,6) = 1. Using this result, it is proved that if p(x,y) is of the form $2^{n(x,y)}$, then D is commutative. (author). 7 refs.

22509 (IC–95/72) **On derived groups of division rings II.** Mahdavi Hezavehi, M. (International Centre for Theoretical Physics, Trieste (Italy)); Akbari Feyzaabaadi, S.; Mehraabaadi, M.; Hajie Abolhassan, H. International Centre for Theoretical Physics, Trieste (Italy). May 1995. 5p. Order Number DE95633902. Source: OSTI; NTIS (US Sales Only); INIS.

Let D be a division ring with centre F and denote by D' the derived group (commutator subgroup) of D* = D - {0}. It is shown that if each element of D' is algebraic over F, then D is algebraic over F. It is also proved that each finite separable extension of F in D is of the form F(c) for some element c in the derived group D'. Using these results, it is shown that if each element of the derived group D' is of bounded degree over F, then D is finite dimensional over F. (author). 5 refs.

22510 (IC–95/81) **Quantum dissipation is a dynamical collective effect.** Gruver, J.L. (International Centre for Theoretical Physics, Trieste (Italy)); Aliaga, J.; Cerdeira, H.A.; Proto, A.N. International Centre for Theoretical Physics, Trieste (Italy). May 1995. 16p. Order Number DE95633903. Source: OSTI; NTIS (US Sales Only); INIS.

We show that the dissipative dynamics observed in a small quantum system coupled to a large one (the bath) is a consequence of increasing the size of the bath. We exemplify this effect with a quantum harmonic oscillator coupled to N harmonic oscillators. We find that revivals in the level population exists and give an estimate of their period. For large values of N, the level population decays exponentially coming into thermal equilibrium. We conclude that quantum dissipation is a dynamical collective effect. Finally, we discuss extensions beyond the harmonic oscillator. (author). 31 refs, 2 figs.

Source: OSTI; NTIS (US Sales Only); INIS.

Charge and current densities are determined periodically varying in time and located in the final area of S space and possessing the property that electromagnetic potentials disappear beyond S. The conditions under which this phenomenon takes place are found. 10 refs.

22513 (JINR-R–2-94-150, pp. 153-157) **Elliptically deformed classical mechanics in three-dimensional phase space.** Yamaleev, R.M. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 159p. (In Russian). (CONF-9310435–: 6. Seminar on the gravitational energy and gravitational waves, Dubna (Russian Federation), 26-30 Oct 1993). In *Gravitational energy and gravitational waves.* Order Number DE95633241. Source: OSTI; NTIS (US Sales Only); INIS.

Basic concepts of classical mechanics in 3 D phase space which can be interpreted as elliptically deformed Newton mechanics are formulated. It is shown that the Nam bu equations play the role of Hamilton dynamic equations for the deformed mechanics. 7 refs.

22514 (LAMP–95/3) **Down-conversion processes and the parametric approximation.** LAMP Series Report (Laser, Atomic and Molecular Physics), LAMP Series Report (Laser, Atomic and Molecular Physics). Mogilevtsev, D. International Centre for Theoretical Physics, Trieste (Italy). Apr 1995. 8p. Grant FI19/203. Order Number DE95633904. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown that the applicability of the parametric approximation to the processes of photon down-conversion depends on the value of frequency detuning between pump and signal field modes. It is found that for the multi-photon down-version processes the threshold value of detuning exists. If the detuning is smaller than the threshold value the behavior of the average number of photons in signal mode has a singular character in this approximation due to inapplicability of the parametric approximation in this case. (author). 4 refs, 2 figs.

The last results of Monte Carlo modelling of e^+ radiative self-polarization in bend crystals evidenced on real possibility of using this effect for transverse polarization of e^+- beams in TeV range. New suggestion on crystals using for production and analysis of polarized proton beams at TeV acceleration are discussed. 3 refs.; 3 figs.

22516 (LA-UR–95-1540) **Phase-scan analysis results for the first drift tube linac module in the ground test accelerator: Data reproducibility and comparison to simulations.** Johnson, K.F. (and others); Sander, O.R.; Bolme, G.O. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by Department of the Army, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–145: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011981. Source: OSTI; NTIS; INIS; GPO Dep.

The Ground Test Accelerator (GTA) had the objective of producing a high-brightness, high-current H- beam. The major accelerator components were a 35 keV injector, a Radio Frequency Quadrupole, an intertank matching section, and a drift tube linac (DTL), consisting of 10 modules. This paper discusses the phase-scan technique which was used to experimentally determine the rf operating parameters for the commissioning and routine operation of the first DTL module.

22517 (LBL–36132) **Radiation and gas conduction heat transport across a helium dewar multilayer insulation system.** Green, M.A. Lawrence Berkeley Lab., CA (United States). 10 Oct 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95012324. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes a method for calculating mixed heat transfer through the multilayer insulation used to insulate a 4 K liquid helium cryostat. The method described here permits one to estimate the insulation potential for a multilayer insulation system from first principles. The heat transfer regimes included are: radiation, conduction by free molecule gas conduction, and conduction through continuum gas conduction. Heat transfer in the transition region between the two gas conduction regimes is also included.

22518 (ANL/MCS/CP–84761) **Parallel molecular dynamics: Communication requirements for massively parallel machines.** Taylor, V.E. (Northwestern Univ., Evanston, IL (United States). Dept. of Electrical Engineering and Computer Science); Stevens, R.L.; Arnold, K.E. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9502101–2: Frontiers 95: a workshop on future directions of massively parallel processing, McLean, VA (United States), 6-9 Feb 1995). Order Number DE95012948. Source: OSTI; NTIS; GPO Dep.

Molecular mechanics and dynamics are becoming widely used to perform simulations of molecular systems from large-scale computations of materials to the design and modeling of drug compounds. In this paper we address two major issues: a good decomposition method that can take advantage of future massively parallel processing systems for modest-sized problems in the range of 50,000 atoms and the communication requirements needed to achieve 30 to 40% efficiency on MPPs. We analyzed a scalable benchmark molecular dynamics program executing on the Intel Touchstone Deleta parallelized with an interaction decomposition method. Using a validated analytical performance model of the code, we determined that for an MPP with a four-dimensional mesh topology and 400 MHz processors the communication startup time must be at most 30 clock cycles and the network bandwidth must be at least 2.3 GB/s. This configuration results in 30 to 40% efficiency of the MPP for a problem with 50,000 atoms executing on 50,000 processors.

22519 (ANL/MCS/CP–85304) **Computational electromagnetics and parallel dense matrix computations.** Forsman, K. (Tampere Univ. of Technology (Finland)); Kettunen, L.; Gropp, W.; Levine, D. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). (CONF-950212–8: 7. Society for Industrial and Applied Mathematics (SIAM) conference on parallel processing for scientific computing, San Francisco, CA (United States), 15-17 Feb 1995). Order Number DE95012286. Source: OSTI; NTIS; GPO Dep.

We present computational results using CORAL, a parallel, three-dimensional, nonlinear magnetostatic code based on a volume integral equation formulation. A key feature of CORAL is the ability to solve, in parallel, the large, dense systems of linear equations that are inherent in the use of integral equation methods.

Using the Chameleon and PSLES libraries ensures portability and access to the latest linear algebra solution technology.

22520 (DOE/ER/13916–T3) **Turbulence and spatio-temporal chaos. Final Report.** Jayaprakash, C.; Hayot, F. Ohio State Univ., Columbus, OH (United States). Dept. of Physics. [1995]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER13916. Order Number DE95012912. Source: OSTI; NTIS; GPO Dep.

Turbulence phenomena encompass many behaviors at many scales, from chaotic behavior at small scales to coherent structures at large scales. The crucial question is how different scales interact. We have sought clues to a general answer by raising the following questions: Can a deterministic chaotic system described by a determininstic partial differential equation (the Kuramoto-Sivashinsky equation) be characterized at large scales by the same static and dynamic scaling exponents that determine a stochastic equation (the Kardar-Parisi-Zhang equation)? Through an extensive numerical study in both one and two dimensions we have concluded that truly, on large scales, the Kuramoto-Sivashinsky and Kardar-Parisi-Zhang equations belong to the same universality class. The procedure (pioneered by Zaleski) involves coarse graining in Fourier space. Through a detailed analysis of its features, and in particular the effective noise-noise correlation, we are able to comprehend the magnitudes of the physical parameters, and in particular estimate the cross-over times from free to interacting behavior.

22521 (DOE/ER/40561–194) **Kaon condensation in dense stellar matter.** Lee, Chang-Hwan (Seoul National Univ. (Korea, Republic of)); Rho, M. Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory. Mar 1995. 30p. Sponsored by USDOE, Washington, DC (United States);Korea Ministry of Education (Korea). DOE Contract FG06-90ER40561. G bsri-94-2418. Order Number DE95012175. Source: OSTI; NTIS; INIS; GPO Dep.

This article combines two talks given by the authors and is based on Works done in collaboration with G.E. Brown and D.P. Min on kaon condensation in dense baryonic medium treated in chiral perturbation theory using heavy-baryon formalism. It contains, in addition to what was recently published, astrophysical backgrounds for kaon condensation discussed by Brown and Bethe, a discussion on a renormalization-group analysis to meson condensation worked out together with H.K. Lee and S.J. Sin, and the recent results of K.M. Westerberg in the bound-state approach to the Skyrme model. Negatively charged kaons are predicted to condense at a critical density $2 \lesssim \rho/\rho o \lesssim 4$, in the range to allow the intriguing new phenomena predicted by Brown and Bethe to take place in compact star matter.

22522 (DOE/ER/45378–T5) **Applications of mesoscopic physics to novel correlations and fluctuations of speckle patterns: Imaging and tomography with multiply scattered classical waves. Final report.** Feng, Shechao Charles. California Univ., Los Angeles, CA (United States). Dept. of Physics. Feb 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-88ER45378. Order Number DE95014759. Source: OSTI; NTIS; GPO Dep.

This is the final report on the grant, entitled 'applications of mesoscopic physics to novel correlations and fluctuations of speckle patterns: imaging and tomography with multiply scattered classical waves', which expired on September 14, 1994. The author summarizes the highlights of this research program, and lists the publications supported by this grant. The report is divided into sections, titled: application of mesoscopic fluctuations theory to correlations and fluctuations of multiply scattered light; quantum transport in localized electronic systems; electron-phonon inelastic scattering rate and the temperature scaling exponent in integer quantum Hall effect; high frequency quantum transport in quantum well devices.

22523 (DOE/ET/53088–706) **Sinuous oscillations and steady warps of polytropic disks.** Balmforth, N.J. (Texas Univ., Austin, TX (United States). Fusion Research Center); Spiegel, E.A. Texas Univ., Austin, TX (United States). Fusion Research Center. May 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–706). Order Number DE95013473. Source: OSTI; NTIS; INIS; GPO Dep.

In an asymptotic development of the equations governing the equilibria and linear stability of rapidly rotating polytropes we employed the slender aspect of these objects to reduce the three-dimensional partial differential equations to a somewhat simpler, ordinary integro-differential form. The earlier calculations dealt with isolated objects that were in centrifugal balance, that is the centrifugal acceleration of the configuration was balanced largely by self gravity with small contributions from the pressure gradient. Another interesting situation is that in which the polytrope rotates subject to externally imposed gravitational fields. In astrophysics, this is common in the theory of galactic dynamics because disks are unlikely to be isolated objects. The dark halos associated with disks also provide one possible explanation of the apparent warping of many galaxies. If the axis of the highly flattened disk is not aligned with that of the much less flattened halo, then the resultant torque of the halo gravity on the disk might provide a nonaxisymmetric distortion or disk warp. Motivated by these possibilities we shall here build models of polytropic disks of small but finite thickness which are subjected to prescribed, external gravitational fields. First we estimate how a symmetrical potential distorts the structure of the disk, then we examine its sinuous oscillations to confirm that they freely decay, hence suggesting that a warp must be externally forced. Finally, we consider steady warps of the disk plane when the axis of the disk does not coincide with that of the halo.

22524 (FNAL/C–95/065) **Software engineering methods and standards used in the sloan digital sky survey.** Petravick, D. (Fermi National Accelerator Lab., Batavia, IL (United States)); Berman, E.; Gurbani, V.; Nicinski, T.; Pordes, R.; Rechenmacher, R.; Sergey, G.; Lupton, R.H. Fermi National Accelerator Lab., Batavia, IL (United States). Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States);Sloan (Alfred P.) Foundation, New York, NY (United States). DOE Contract AC02-76CH03000. (CONF-9504108–1: 4. international workshop on software engineering, artificial intelligence and expert systems for high-energy and nuclear physics, Pisa (Italy), 3-8 Apr 1995). Order Number DE95013239. Source: OSTI; NTIS; GPO Dep.

We present an integrated science software development environment, code maintenance and support system for the Sloan Digital Sky Survey (SDSS) now being actively used throughout the collaboration. The SDSS is a collaboration between the Fermi National Accelerator Laboratory, the Institute for Advanced Study, The Japan Promotion Group, Johns Hopkins University, Princeton University, The United States Naval Observatory, the University of Chicago, and the University of Washington. The SDSS will produce a five-color imaging survey of 1/4 of the sky about the north galactic cap and image 10^8 Stars, 10^8 galaxies, and 10^5 Quasars. Spectra will be obtained for 10^6 galaxies and 10^5 Quasars as well. The survey will utilize a dedicated 2.5 meter telescope at the Apache Point Observatory in New Mexico. Its imaging camera will hold 54 Charge-Coupled Devices (CADS). The SDSS will take five years to complete, acquiring well over 12 TB of data.

22525 (IC–95/21) **Tangent cones at infinity under quadratic sectional curvature decay.** Pacelli Bessa, G. (International Centre for Theoretical Physics, Trieste (Italy)); Marenich, V. International Centre for Theoretical Physics, Trieste (Italy). Feb 1995. 8p. Order Number DE95633918. Source: OSTI; NTIS (US Sales Only); INIS.

We consider limits in the Hausdorff-Gromov metrics of sequences of pointed open manifolds of non-negative Ricci curvature of special type, called Tangent Cones at Infinity. Under an assumption of quadratic sectional curvature decay we prove some rigidity and structure theorems, giving in particular an affirmative answer to conjectures by M. Anderson and T. Yamaguchi. (author). 11 refs.

22526 (IC–95/26) **Haldane's statistical interactions and universal properties of anyon systems.** Protogenov, A. International Centre for Theoretical Physics, Trieste (Italy). Mar 1995. 9p. Grant 95-02-05620; 94-31-4-20. Order Number DE95633919. Source: OSTI; NTIS (US Sales Only); INIS.

The exclusion principle of fractional statistics proposed by Haldane is applied to systems with internal degrees of freedom. The symmetry of these systems is included in the statistical interaction

matrix which contains the Cartan matrix of Lie algebras. The solutions of the equations for the statistical weights, which coincide with the thermodynamic Bethe ansatz equations are determined in the high temperature limit by the squares of q-deformed dimensions of irreducible representations. The entropy and other thermodynamic properties of anyon systems in this limit are completely characterized by the algebraic structure of symmetry in the universal form. (author). 39 refs.

22527 (IC–95/79) **Sobolev imbedding theorems for degenerate metrics.** Nguyen Minh Tri. International Centre for Theoretical Physics, Trieste (Italy). May 1995. 10p. Order Number DE95633920. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of the paper is to point out some similar properties for the Laplace's equation in R^n ($n \geq 3$) and the hypoelliptic equation in R^2 ($k \geq 1$). 11 refs.

22528 (JINR-R–2-94-150, pp. 115-120) **Correlation analysis of extremely low-frequency variations of the natural electromagnetic Earth field and the problem of detecting periodical gravitational radiation.** Balakin, A.B. (Kazanskij Univ, Kazan (Russian Federation)); Murzakhanov, Z.G.; Grunskaya, L.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 159p. (In Russian). (CONF-9310435–: 6. Seminar on the gravitational energy and gravitational waves, Dubna (Russian Federation), 26-30 Oct 1993). In *Gravitational energy and gravitational waves*. Order Number DE95633241. Source: OSTI; NTIS (US Sales Only); INIS.

A proposal on the experimental detection of extremely low-frequency variations of the electromagnetic Earth field at the gravitational-wave frequency and method for correlation processing results of the experiments are described. 14 refs.

22529 (LA-SUB–95-55) **Interface deformation in low reynolds number multiphase flows: Applications to selected problems in geodynamics.** Gable, C. (Los Alamos National Lab., NM (United States)); Travis, B.J.; O'Connell, R.J.; Stone, H.A. Los Alamos National Lab., NM (United States); Harvard Univ., Cambridge, MA (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95012953. Source: OSTI; NTIS; GPO Dep.

Flow in the mantle of terrestrial planets produces stresses and topography on the planet's surface which may allow us to infer the dynamics and evolution of the planet's -interior. This project is directed towards understanding the relationship between dynamical processes related to buoyancy-driven flow and the observable expression (e.g. earthquakes, surface topography) of the flow. Problems considered include the ascent of mantle plumes and their interaction with compositional discontinuities, the deformation of subducted slabs, and effects of lateral viscosity variations on post-glacial rebound. We find that plumes rising from the lower mantle into a lower-viscosity upper mantle become extended vertically. As the plume spreads beneath the planet's surface, the dynamic topography changes from a bell-shape to a plateau shape. The topography and surface stresses associated . with surface features called arachnoids, novae and coronae on Venus are consistent with the surface expression of a rising and spreading buoyant volume of fluid. Short wavelength viscosity variations, or sharp variations of lithosphere thickness, have a large effect on surface stresses. This study also considers the interaction and deformation of buoyancy-driven drops and bubbles in low Reynolds number multiphase systems. Applications include bubbles in magmas, the coalescence of liquid iron drops during core formation, and a wide range of industrial applications. Our methodology involves a combination of numerical boundary integral calculations, experiments and analytical work. For example, we find that for deformable drops the effects of deformation result in the vertical alignment of initially horizontally offset drops, thus enhancing the rate of coalescence.

22530 (LA-SUB–95-58) **The confirmation of the 2.1 ms candidate for PSR1987A and the 1000-hour Arecibo Piggyback ms Pulsar Survey. Final report.** Middleditch, J. (Los Alamos National Lab., NM (United States)); Kulkarni, S. Los Alamos National Lab., NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95012955. Source: OSTI; NTIS; GPO Dep.

The authors objectives included (1) The confirmation of the 2.1 ms candidate for the pulsar (PSR1987A) in Supernova 1987A (SN1987A), and, provided the candidate is real (and if it is real, the authors have successfully tracked its frequency for two years), (2) to determine the nature of its spindown, including whether it is a result of gravitational radiation (GR), inertia transfer associated with differential rotation, changes in the moment of inertia, or the affects of a wide binary system. The authors have decent results to support the supposition that the spindown of this candidate for PSR1987A is indeed due almost entirely to gravitational radiation. The observations with the University of Tasmania 1-m telescope were successful in detecting the 2.1 ms candidate pulsar on at least three occasions. They can conclude that there is now little doubt that SN1987A was the result of a merger of two giant stars which resulted in: (1) The ejection of the three rings during a common-envelope/Roche lobe overflow phase which may have lasted only 300 to 1,000 years some 30,000 years ago, (2) The extreme mixing of the elements during the spiraling in phase of the two ~0.7 solar mass white dwarf cores, (3) The blue supergiant nature of the progenitor star, Sk-69 202, and (4) the formation of a weak-field ms pulsar spinning every 2.1 ms. The importance of this finding is nearly inestimable. The authors now know that neutron stars can sustain or grow oblatenesses of 5 parts in ten million some 5-7 years after their explosive birth, and that pulsars born in such a way can outshine all other compact solar mass type objects by an order of magnitude in nearly pure gravitational radiation. They know now that most weak field ms, pulsars are born in such core mergers, which explains their drastic overabundance in the globular clusters relative to the low mass X-ray binaries, which were previously, and erroneously thought of as their progenitors.

22531 (SSCL–469) **Geometric phases in self-induced transparency.** Sen, T. (Superconducting Super Collider Lab., Dallas, TX (United States)); Milovich, J. Superconducting Super Collider Lab., Dallas, TX (United States). May 1991. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011143. Source: OSTI; NTIS; INIS; GPO Dep.

We consider the geometric phases arising in the lossless propagation of light pulses through a medium composed of near resonant two-level atoms. A reformulation of the coupled Maxwell-Schroedinger equations allows us to construct conservation laws in a general context. There exist periodic solutions of these equations which lead to the possibility of cyclical evolution of the state vector and the appearance of a geometric phase. We first show that if the ground state is the initial state of the system, then it acquires a geometric phase after the passage of the soliton pulses of McCall and Hahn. More generally if the initial state is a superposition of the two levels, continuous pulse trains can propagate without appreciable loss. We also find in this case that the state vector develops a geometric phase provided the parameters take on the particular values required for cyclical evolution. In both cases we exhibit the geometric character of the calculated phases by showing that they equal half the solid angle subtended by a closed curve traced by the Bloch, vector on the Bloch sphere. We verify a recent assertion of Anandan and Aharonov that the energy uncertainty in the state is directly related to the speed at which the tip of the Bloch vector moves along the curve on the Bloch sphere (or in more general terms the energy uncertainty is related to the speed in the projective Hilbert space).

22532 (SSCL–539) **High frequency breakdown voltage.** Chu, Thanh Duy. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1992. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011146. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains information about the effect of frequency on the breakdown voltage of an air gap at standard pressure and temperature, 76 mm Hg and O°C, respectively. The frequencies of interest are 47 MHz and 60 MHz. Additionally, the breakdown in vacuum is briefly considered. The breakdown mechanism is explained on the basis of collision and ionization. The presence of the positive ions produced by ionization enhances the field in the gap, and thus determines the breakdown. When a low-frequency voltage is applied across the gap, the breakdown mechanism is

the same as that caused by the DC or static voltage. However, when the frequency exceeds the first critical value f_c, the positive ions are trapped in the gap, increasing the field considerably. This makes the breakdown occur earlier; in other words, the breakdown voltage is lowered. As the frequency increases two decades or more, the second critical frequency, f_{ce}, is reached. This time the electrons start being trapped in the gap. Those electrons that travel multiple times across the gap before reaching the positive electrode result in an enormous number of electrons and positive ions being present in the gap. The result is a further decrease of the breakdown voltage. However, increasing the frequency does not decrease the breakdown voltage correspondingly. In fact, the associated breakdown field intensity is almost constant (about 29 kV/cm).The reason is that the recombination rate increases and counterbalances the production rate, thus reducing the effect of the positive ions' concentration in the gap. The theory of collision and ionization does not apply to the breakdown in vacuum. It seems that the breakdown in vacuum is primarily determined by the irregularities on the surfaces of the electrodes. Therefore, the effect of frequency on the breakdown, if any, is of secondary importance.

22533 (SSCL-Preprint–554) **Dissipative model for a two component gas system with friction.** Lopez, G. (Superconducting Super Collider Lab., Dallas, TX (United States)); Murgia, M.; Sosa, M. Superconducting Super Collider Lab., Dallas, TX (United States). Feb 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011157. Source: OSTI; NTIS; INIS; GPO Dep.

For a mixture of small and large component of gases, the large component is treated as an ideal gas. A dissipative model is proposed for the small component, and the thermodynamic characteristics of the gas are derived through a statistical mechanical approach. The model requires for the small component to have a big dimension and its number of particles to be smaller than the large one. Using the associated partition function, the internal energy and the equation of state are calculated. The internal energy does not suffer any deviation from that of the two component ideal gas, but the equation of state deviates from that of the ideal gas for large values of the parameter which characterizes the dissipative model.

22534 (UCRL-JC–119032) **The OPAL opacity code: New results.** Rogers, F.J.; Iglesias, C.A. Lawrence Livermore National Lab., CA (United States). [1994]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9408236–1: Astronomical Society of the Pacific conference, Hague (Netherlands), 15-27 Aug 1994). Order Number DE95011729. Source: OSTI; NTIS; GPO Dep.

The OPAL code was developed to calculate the wide range of frequency-dependent and mean opacity data needed to model laboratory experiments and stellar interiors. We use parametric potentials to generate vastly more atomic data than used in earlier opacity work for all elements with atomic number less than 35. We have also developed an improved equation of state based on an activity expansion of the grand canonical partition function. We give herein a brief description of the OPAL code and present new results that include the effect of additional heavy elements compared to our earlier carbons. The importance of very heavy elements having atomic number greater than 30 is also discussed. We present some comparisons with recent results from the Opacity Project and some directions for future work.

22535 (UCRL-JC–120557) **ORFEUS and EUVE observations of AM herculis.** Mauche, C.W. (Lawrence Livermore National Lab., CA (United States)); Paerels, F.B.S.; Raymond, J.C. Lawrence Livermore National Lab., CA (United States). 6 Apr 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950189–1: ASP conference: Cape workshop on magetic cataclysmic variables, Cape Town (South Africa), 23-25 Jan 1995). Order Number DE95012456. Source: OSTI; NTIS; GPO Dep.

Far-UV spectra of AM Her in a high optical state were obtained in 1993 September with the University of California, Berkeley (UCB) spectrometer aboard the ORFEUS telescope. The UCB spectrometer has a spectral resolution $\lambda/\Delta\lambda$ 3000 and covers the 390-1170 Å bandpass, but interstellar absorption leaves no detectable -flux below the Lyman limit. Spectra of AM Her were acquired during the intervals 04:19:40-04:36:26 UT on September 16 and 08:34:03-09:09:06 UT on September 17 of 1993. The corresponding magnetic phases are 0.75-0.84 and 0.88-1.07 according to the linear polarization ephemeris of S. Tapia. The main spectral features are the O VI doublet, C III λ977, and He II λ1085 (Balmer γ). The bright C III λ1176 multiplet, which is detected by IUE, is at the very end of the spectrum. At the full spectral resolution of the instrument, the O VI doublet shows broad and narrow components similar to that of the optical emission lines. The intensity ratio of the narrow component of the O VI doublet is $\sim$ 1.3:1, much closer to the optically thick limit of 1:1 than the optically thin ratio of 2:1.

22536 (UCRL-LR–118510) **High order harmonic generation in rare gases.** Budil, K.S. Lawrence Livermore National Lab., CA (United States). 1 May 1994. 117p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012454. Source: OSTI; NTIS; GPO Dep.

The process of high order harmonic generation in atomic gases has shown great promise as a method of generating extremely short wavelength radiation, extending far into the extreme ultraviolet (XUV). The process is conceptually simple. A very intense laser pulse (I $\sim 10^{13}$-10^{14} W/cm^2) is focused into a dense ($\sim 10^{17}$ particles/cm^3) atomic medium, causing the atoms to become polarized. These atomic dipoles are then coherently driven by the laser field and begin to radiate at odd harmonics of the laser field. This dissertation is a study of both the physical mechanism of harmonic generation as well as its development as a source of coherent XUV radiation. Recently, a semiclassical theory has been proposed which provides a simple, intuitive description of harmonic generation. In this picture the process is treated in two steps. The atom ionizes via tunneling after which its classical motion in the laser field is studied. Electron trajectories which return to the vicinity of the nucleus may recombine and emit a harmonic photon, while those which do not return will ionize. An experiment was performed to test the validity of this model wherein the trajectory of the electron as it orbits the nucleus or ion core is perturbed by driving the process with elliptically, rather than linearly, polarized laser radiation. The semiclassical theory predicts a rapid turn-off of harmonic production as the ellipticity of the driving field is increased. This decrease in harmonic production is observed experimentally and a simple quantum mechanical theory is used to model the data. The second major focus of this work was on development of the harmonic "source". A series of experiments were performed examining the spatial profiles of the harmonics. The quality of the spatial profile is crucial if the harmonics are to be used as the source for experiments, particularly if they must be refocused.

22537 (SSC–250-Rev.) **Report of the Ad Hoc Committee on SSC physics.** Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1990. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011177. Source: OSTI; NTIS; INIS; GPO Dep.

The Ad Hoc Committee on SSC Physics has reexamined the relationship between beam energy, machine luminosity, and physics capability. In the next section, the physics motivation for the SSC is reviewed in general terms. This is followed by a discussion of the ability to detect a number of specific processes as a function of the SSC energy and luminosity. The viability of various detector technologies is then assessed as a function of luminosity. The report ends with a brief summary and some conclusions.

22540 (ANL-HEP-CP–94-79) **Scale-invariant Lipatov kernels from t-channel unitarity.** Coriano, C.; White, A.R. Argonne National Lab., IL (United States). 14 Nov 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9409257–2: 24. international symposium on multiparticle dynamics, Vietri sul Mare (Italy), 12-19 Sep 1994). Order Number DE95004625. Source: OSTI; NTIS; INIS; GPO Dep.

The Lipatov equation can be regarded as a reggeon Bethe-Salpeter equation in which higher-order reggeon interactions give higher-order kernels. Infra-red singular contributions in a general kernel are produced by t-channel nonsense states and the allowed kinematic forms are determined by unitarity. Ward identity and infra-red finiteness gauge invariance constraints then determine the corresponding scale-invariant part of a general higher-order kernel.

22541 (IC–95/63) **On the geometry of large-scale distribution of galaxies (spontaneous violation of the cosmological principle).** Budinich, P. (International Centre for Theoretical Physics, Trieste (Italy)); Nurowski, P.; Raczka, R.; Ramella, M. International Centre for Theoretical Physics, Trieste (Italy). Apr 1995. 8p. (ILAS/FM–9/1994.). Order Number DE95631723. Source: OSTI; NTIS (US Sales Only); INIS.

Recent observations on the distribution of galaxies in the universe have revealed large-scale structures whose origin seems difficult to explain in the frame of most cosmological theories. The most famous is the Great Wall: a $\approx$50 by $\approx$100 Mpc/h-structure (where $h \simeq 0.5 - 1$) is Hubble's constant in units of 100 km.s^{-1} Mpc^{-1} discovered in 1989 at a distance of $\approx$80 Mpc/h in the northern hemisphere. The most recent is the South Wall, discovered recently, slightly nearer to us, in the southern hemisphere. Further observations, known as pencil-beam surveys, have revealed in 1990 and confirmed later correlations in galaxy distributions with a periodicity of 128 Mpc/h in some particular directions (N-S Galactic poles). The main interest of these large-scale structures lies in the fact they cannot be ascribed to gravitation. Therefore they might represent unexpected violations of the Cosmological Principle (stating: "the spatial isotropy and uniformity of the universe"). Here we propose a simple model, based on a wave equation which foresees eigenvibrations of a Robertson-Walker universe. Just one of these allows reproduction of the main features of most of the observed large-scale structures. It also allows predictions of wave-structures in the distribution of galaxies at large distances which, if observed (or not) could represent a proof (or a disproof) of the model. In this case the observed structured would represent a natural violation of the Cosmological principle: one of those well known in physics with the name "spontaneous" symmetry breaking. (author). 15 refs, 4 figs.

22542 (IC–95/68) **Stationary solutions of the Maxwell-Dirac and the Klein-Gordon-Dirac equations.** Esteban, M.J. (Paris Dauphine Univ., Paris (France). CEREMADE (URA CNRS 749)); Georgiev, V.; Sere, E. International Centre for Theoretical Physics, Trieste (Italy). 1995. 22p. Order Number DE95633928. Source: OSTI; NTIS (US Sales Only); INIS.

The Maxwell-Dirac system describes the interaction of an electron with its own electromagnetic field. We prove the existence of soliton-like solutions of Maxwell-Dirac in (3+1)-Minkowski space-time. The solutions obtained are regular, stationary in time, and localized in space. They are found by a variational method, as critical points of an energy functional. This functional is strongly indefinite and presents a lack of compactness. We also find soliton-like solutions for the Klein-Gordon-Dirac system, arising in the Yukawa model. (author). 32 refs.

The principal concepts of strong-interaction model based on the exact solutions of vacuum equations are formulated. Mathematical tools applied to quantum theory of scattering in the NUT field are reported. New theoretical results are presented, theoretical and experimental data are compared. Some anomalous effects in high-energy spin physics are explained qualitatively. 17 refs., 1 fig.

22554 (LA-UR-95-1375) **Nonequilibrium problems in quantum field theory and Schwinger's closed time path formalism.** Cooper, F. Los Alamos National Lab., NM (United States). [1995]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950299--1: International symposium on unified symmetry: in the small and in the large, Miami, FL (United States), 2-5 Feb 1995). Order Number DE95012056. Source: OSTI; NTIS; INIS; GPO Dep.

We review the closed time path formalism of Schwinger using a path integral approach. We apply this formalism to the study of pair production from strong external fields as well as the time evolution of a nonequilibrium chiral phase transition. In 1961 in his classic paper "Brownian Motion of a Quantum Particle," Schwinger solved the formidable technical problem of how to use the action principle to study initial value problems. Previously, the action principle was formulated to study only transition matrix elements from an earlier time to a later time. The elegant solution of this problem was the invention of the closed time path (CTP) formalism. This formalism was first used to study field theory problems by Mahanthappa and Bakshi. With the advent of supercomputers, it has now become possible to use this formalism to numerically solve important field theory questions which are presented as initial value problems. Two of these problems we shall review here. They are (1) The time evolution of the quark- gluon plasma. (2) Dynamical evolution of a non-equilibrium chiral phase transition following a relativistic heavy ion collision.

22555 (LBL--36819) **Broken flavor symmetries in high energy particle phenomenology.** Antaramian, A. Lawrence Berkeley Lab., CA (United States). 22 Feb 1995. 103p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (UCB-PTH-95/05). Order Number DE95012353. Source: OSTI; NTIS; INIS; GPO Dep.

Over the past couple of decades, the Standard Model of high energy particle physics has clearly established itself as an invaluable tool in the analysis of high energy particle phenomenon. However, from a field theorists point of view, there are many dissatisfying aspects to the model. One of these, is the large number of free parameters in the theory arising from the Yukawa couplings of the Higgs doublet. In this thesis, we examine various issues relating to the Yukawa coupeng structure of high energy particle field theories. We begin by examining extensions to the Standard Model of particle physics which contain additional scalar fields. By appealing to the flavor structure observed in the fermion mass and Kobayashi-Maskawa matrices, we propose a reasonable phenomenological parameterization of the new Yukawa couplings based on the concept of approximate flavor symmetries. It is shown that such a parameterization eliminates the need for discrete symmetries which limit the allowed couplings of the new scalars. New scalar particles which can mediate exotic flavor changing reactions

can have masses as low as the weak scale. Next, we turn to the issue of neutrino mass matrices, where we examine a particular texture which leads to matter independent neutrino oscillation results for solar neutrinos. We, then, examine the basis for extremely strict limits placed on flavor changing interactions which also break lepton- and/or baryon-number. These limits are derived from cosmological considerations. Finally, we embark on an extended analysis of proton decay in supersymmetric SO(10) grand unified theories. In such theories, the dominant decay diagrams involve the Yukawa couplings of a heavy triplet superfield. We argue that past calculations of proton decay which were based on the minimal supersymmetric SU(5) model require reexamination because the Yukawa couplings of that theory are known to be wrong.

22556 (LBL–36962) **Non-universal SUSY breaking, hierarchy and squark degeneracty.** Murayama, Hitoshi. Lawrence Berkeley Lab., CA (United States). 15 Mar 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-941251–5: 4. international conference on physics beyond the standard model, Lake Tahoe, CA (United States), 13-18 Dec 1994). Order Number DE95012377. Source: OSTI; NTIS; INIS; GPO Dep.

I discuss non-trivial effects in the soft SUSY breaking terms which appear when one integrates out heavy fields. The effects exist only when the SUSY breaking terms are non-universal. They may spoil (1) the hierarchy between the weak and high-energy scales, or (2) degeneracy among the squark masses even in the presense of a horizontal symmetry. I argue, in the end, that such new effects may be useful in probing physics at high-energy scales from TeV-scale experiments.

22557 (LBL–37016) **Low energy supersymmetry phenomenology.** Baer, H. (Florida State Univ., Tallahassee, FL (United States). Dept. of Physics); Chen, C.H.; Bartl, A. Lawrence Berkeley Lab., CA (United States); Florida State Univ., Tallahassee, FL (United States). Dept. of Physics; Hawaii Univ., Honolulu, HI (United States). Mar 1995. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098 ; FG05-87ER40319 ; FG03-94ER40833. Order Number DE95012331. Source: OSTI; NTIS; INIS; GPO Dep.

The authors summarize the current status and future prospects for low energy (weak scale) supersymmetry. In particular, they evaluate the capabilities of various e^+e^-, $p\bar{p}$ and pp colliders to discover evidence for supersymmetric particles. Furthermore, assuming supersymmetry is discovered, they discuss capabilities of future facilities to disentangle the anticipated spectrum of superparticles, and, via precision measurements, to test mass and coupling parameters for comparison with various theoretical expectations. They comment upon the complementarity of proposed hadron and e^+e^- machines for a comprehensive study of low energy supersymmetry.

22558 (SSCL-Preprint–21) **Vacuum orientations in strong CP violation.** Huang, Zheng (Simon Fraser Univ., Burnaby, BC (Canada). Dept. of Physics); Viswanathan, K.S.; Wu, Dan-di. Superconducting Super Collider Lab., Dallas, TX (United States). Dec 1991. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011257. Source: OSTI; NTIS; INIS; GPO Dep.

We study the QCD vacuum orientation angles in correlation with the strong CP phases. A vacuum alignment equation of the dynamical chiral symmetry breaking is derived based on the anomalous Ward identity. It is emphasized that a chiral rotation of the quark field causes a change of the vacuum orientation and a change in the definition of the light pseudoscalar generators. As an illustration of the idea, $\eta \to 2\pi$ decays are carefully studied in different chiral frames and shown to be independent of. chiral rotations.

22559 (SSCL-Preprint–506-93) **Low energy gauge couplings in grand unified theories and high precision physics.** Lynn, B.W. (Stanford Univ., CA (United States). Dept. of Physics). I generalize the leading log relations between low energy $SU(3)_{QCD}$, $SU(2)_{-}$ and $U(I)_Y$ effective gauge couplings to include all one-loop threshold effects of matter fields in oblique vector self energy quantum corrections for both supersymmetric and non-supersymmetric SU(5) grand unified theories. These always involve an exactly conserved current from the unbroken $SU(3)_{QCD} \times U(L)_{QED}$ subgroup; this fact strongly constrains any non-decoupling of heavy states as well as the generic character of threshold effects. Relations between low energy gauge couplings depend on the details of the spectra of both the superheavy and low mass sectors; I display the common origin of the logs appropriate to superheavy matter states, which can be found with well known renormalization group techniques, and the combination of logs and polynomials appropriate for light matter states, which cannot. Relations between any two or all three low energy effective gauge couplings do not depend on the top quark or standard model Higgs' masses. Neither do they depend on neutral color singlet states such as other neutral color singlet Higgs' or higgsinos, neutrinos, zinos or photinos. Further, they do not depend on degenerate SU(5) matter representations, of either spin 0 or spin 1/2 of any mass; matter representations of SU(5) can affect such relations only if there is mass splitting within them. The b quark splitting from the τ and ν_τ can affect the relation between gauge couplings for $|q_2| \to m_b{}^2$ as can hadronic resonances and multi-hadron states for lower $|q_2|$. New mass-split representations of light states, such as occur in supersymmetric theories, can also affect such relations.

22560 (SSCL-Preprint–526) **High p_t physics processes.** Bird, F.; Blocker, C.; Fukui, T.; McBride, P.; Paige, F.; Pal, T.; Takashima, M.; Turcotte, M.; Siegrist, J. Superconducting Super Collider Lab., Dallas, TX (United States). Oct 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011139. Source: OSTI; NTIS; INIS; GPO Dep.

In order to estimate the "physics reach" of various pp or $\bar{p}p$ colliders, several physics processes of interest have been studied. For each process, the number of produced events required to carry out meaningful.physics studies or detect statistically significant signals has been estimated. These estimates are largely based on detailed studies for the SDC and GEM design reports. Extrapolation to other energies takes into account calculated cross sections and crude background estimates. To convert the required number of events into an average luminosity to be delivered by the machine, a "running year" of 10^7 seconds is used. This time is consistent with SSC design plans, which call for an 80% detector up time and enough stable beam time to result in 10^7 "live" seconds per operating year. Note that when making comparisons with existing facilities, any deviation from these assumptions should be taken into account. The conclusions of this study are generally sim-ilar to those reached by Eichten, et al. in 1984 and by the Drell Panel in 1990.

The development of the Standard Model of particle physics is a remarkable success story. Its many facets have been tested at present day accelerators; no significant unambiguous deviations have yet been found. In some cases, the model has been verified at an accuracy of better than one part in a thousand. This state of affairs presents our field with a challenge. Where do we go from here? What is our vision for future developments in particle

physics? Are particle physicists' recent successes a signal of the field's impending demise, or do real long-term prospects exist for further progress? We assert that the long-term health and intellectual vitality of particle physics depends crucially on the development of a new generation of particle colliders that push the energy frontier by an order of magnitude beyond present capabilities. In this report, we address the scientific issues underlying this assertion.

22562 (BNL–61794) **To VMD, or not to VMD, in the quark-gluon plasma.** Pisarski, R.D. Brookhaven National Lab., Upton, NY (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9502102–1: International workshop on chiral dynamics in hadrons and nuclei, Seoul (Korea, Republic of), 6-10 Feb 1995). Order Number DE95013321. Source: OSTI; NTIS; INIS; GPO Dep.

I review results on the shift of the ρ meson mass at nonzero temperature in a gauged linear sigma model, under the assumption of strict vector meson dominance.

22563 (DOE/ER/40561–176) **QCD and hadron structure.** Kaplan, D.B. Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory. [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER40561. (CONF-9507126–1: Nuclear theory town meeting, Argonne, IL (United States), 20-30 Jul 1995). Order Number DE95012173. I give a brief and selective overview of QCD as it pertains to determining hadron structure, and the relevant directions in this field for nuclear theory. This document is intended to start discussion about priorities, not end it.

22564 (DOE/ER/40757–059) **Top quark signatures in extended color theories.** Dicus, D.A. (Texas Univ., Austin, TX (United States). Center for Particle Physics); Dutta, B.; Nandi, S. Texas Univ., Austin, TX (United States). Center for Particle Physics. 6 Dec 1994. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-93ER40757 ; FG02-94ER40852. Order Number DE95007099. Source: OSTI; NTIS; INIS; GPO Dep.

We consider the implications of an extended color group, SU $(3)_I$ x SU $(3)_{II}$, spontaneously broken to SU $(3)_c$ at a TeV or lower scale, for the hadronic colliders. The associated massive color octet gauge bosons (the colorons) can enhance the $t\bar{t}$ pair production at the Tevatron collider. At the LHC, the colorons can be pair produced, each decaying to a $t\bar{t}$ pair. This gives rise to anomalous multi W production.

22565 (FNAL/C–95/094) **QCD at D0 and CDF.** Blazey, G.C. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9503147–2: Rencontres de Physique de la Valle' d'Aoste, La Thuile (Italy), Mar 1995). Order Number DE95013003. Source: OSTI; NTIS; INIS; GPO Dep.

Selected recent Quantum Chromodynamics (QCD) results from the D0 and CDF experiments at the Fermilab Tevatron are presented and discussed. The inclusive jet and inclusive triple differential dijet cross sections are compared to next-to-leading order QCD calculations. The sensitivity of the dijet cross section to parton distribution functions (for hadron momentum fractions $\sim$ 0.01 to $\sim$ 0.4) will constrain the gluon distribution of the proton. Two analyses of dijet production at large rapidity separation are presented. The first analysis tests the contributions of higher order processes to dijet production and can be considered a test of BFKL or GLAP parton evolution. The second analysis yields a strong rapidity gap signal consistent with colorless exchange between the scattered partons. The prompt photon inclusive cross section is consistent with next-to-leading order QCD only at the highest transverse momenta. The discrepancy at lower momenta may be indicative of higher order processes impacting a transverse momentum or "k_T" to the partonic interaction. The first measurement of the strong coupling constant from the Tevatron is also presented. The coupling constant can be determined from the ratio of W + 1jet to W + 0jet cross sections and a next-to-leading order QCD calculation.

22566 (IC–95/45) **SU($2N_f$) x 0(3) light diquark symmetry and current-induced heavy baryon transition form factors.** Hussain, F. (International Centre for Theoretical Physics, Trieste (Italy)); Koerner, J.G.; Landgraf, J.; Tawfiq, S. International Centre for Theoretical Physics, Trieste (Italy). May 1995. 19p. (MZ-TH–95-15; Hep-ph–9505335.). Order Number DE95633969. Source: OSTI; NTIS (US Sales Only); INIS.

We study the current-induced bottom baryon to charm baryon transitions in the Heavy Quark Symmetry limit as $m_q \to \infty$. Our discussion involves s-wave to s-wave as well as s-wave to p-wave transitions. Using a constituent quark model picture for the light diquark system with an underlying SU($2N_f$) x 0(3) symmetry and the heavy quark symmetry we arrive at a number of new predictions for the reduced form factors that describe these transitions. (author). 17 refs, 2 tabs.

22567 (IC–95/76) **Models of light singlet fermion and neutrino phenomenology.** Chun, E.J.; Joshipura, A.S.; Smirnov, A.Yu. International Centre for Theoretical Physics, Trieste (Italy). May 1995. 12p. (PRL-TH–95-7; Hep-ph–9505275.). Order Number DE95633955. Source: OSTI; NTIS (US Sales Only); INIS.

We suggest that a single fermion S exists beyond the standard see-saw structure. It mixes with light neutrinos via interactions with the right-handed neutrino components, so that $\nu_e \to$ S conversion solves the solar neutrino problem. Supersymmetry endowed with R-symmetry is shown to give a natural framework for existence, mass scale ($\approx 3 \cdot 10^{-3}$ eV) and mixing ($\sin^2 2\theta_{es} \approx (0.1 - 1.5) \cdot 10^{-2}$) of such a fermion. Models with an approximate horizontal symmetry are constructed, which embed the fermion S and explain simultaneously solar, atmospheric, hot dark matter problems as well as may predict the oscillation ν-bar$_\mu \to \nu$-bar$_e$ in the region of sensitivity of KARMEN and LSND experiments. (author). 24 refs.

22568 (IC–95/80) **Predictions of the top mass in minimal supersymmetric left-right model.** Brahmachari, B. International Centre for Theoretical Physics, Trieste (Italy). May 1995. 9p. Order Number DE95633970. Source: OSTI; NTIS (US Sales Only); INIS.

The one-loop evolution of Yukawa couplings in the minimal supersymmetric left-right model (MSUSYLR) model with a wide variation of the right-handed breaking scale M_R from 1 TeV to 10^{18} GeV is studied assuming that all third generation Yukawa couplings are equal and in the fixed point domain of the top quark Yukawa coupling (h_t) at the Plank scale. We show that: (1) The top quark Yukawa coupling h_t displays a fixed point behaviour that is similar to that of the minimal supersymmetric standard model (MSSM). (2) The MSUSYLR model predicts a value of the top mass in the interval 177 to 184 GeV for α_s in the interval 0.11 to 0.12 (3). A large value of tanβ is required to reproduce the correct mass of the bottom quark and tau lepton. (4) With the experimental value of the ratio $m_b(m_b)/m_\tau(m_\tau)$ as an input the range of the right-handed symmetry breaking scale M_R can be predicted. (5) The numerical value of the Majorana Yukawa coupling h_M can be calculated which is otherwise a completely free parameter. (author). 16 refs, 4 tabs.

22569 (INIS-RU–405, pp. 363-366) **On possibility of observation of anomalous magnetic moment of electrons (positrons) in crystals.** Baryshevskij, V.G.; Shekhtman, A.G. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (In Russian). Submitted to Yadernaya Fizika.

The gap equation for the constituent quark mass in the U(2) x U(2) Nambu-Jona-Lasinio model for the $1/N_c$ approximation is investigated. It is shown that taking into account scalar isovector mesons plays an important role for the correct description of quark

masses in this approximation. The role of the Ward identity in calculations of $1/N_c$ corrections to the meson vertex functions is shortly discussed. 13 refs., 3 figs., 1 tab.

In the standard model the parameters ρ and $M_W^2/M_Z^2\cos^2\theta$ are unity at tree level. They are protected against large corrections by the so-called custodial symmetry. We investigate the symmetry breaking effect of effect of mass splittings in fermion doublets. The effective field theory method is applied to sum up the leading-log QCD corrections. We resolve a controversy concerning the scale at which the strong coupling constant is to be evaluated in the two-loop correction to electorweak parameters.

It is shown that the model used by Shifman, Vainshtein, and Zakharov for the description of the experimental function $R_c(s)$ in the form of a sum of δ-functions and the plateau contradicts the Wilson operator expansion (O.E.) in the terms due to the gluon condensate. A QCD model with an infinite number of vector mesons does satisfy the requirements of the O.E. for masses and electronic width resonances close to the experimental values. The region of allowable values of the masses of c- and b-quarks and the gluon condensate compatible with the O.E. is obtained.

The status and future prospects of searches for and studies of forbidden and highly suppressed K decays are reviewed. Here the author discusses three areas of recent activity in rare K decay. These are lepton-flavor violating decays, which are entirely forbidden in the Standard Model, $K_S \rightarrow \pi^+\pi^-\pi^0$, which is of interest from the point of view of CP-violation, and 'one loop' decays of the form $K^{0,\pm} \rightarrow (\pi^{0,\pm})\ell\bar{\ell}$, that can throw light on Standard Model CP-violation and determine parameters such as V_{td}.

The experimental program supported by the present grant is a continuation of the work supported under DOE Contract DE-AS05-76ER04449. More detailed discussion of the experimental apparatus and earlier activities can be found in annual reports for that contract and this grant. The primary objective of this program is investigation of the nucleon-nucleon (NN) interaction, in the medium-energy region, in both elastic and inelastic channels.

22581 (FNAL/C–95-060-E) **Kinematic top analyses at CDF.** Grassmann, H. CDF Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Mar 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9503147–1: Rencontres de Physique de la Valle' d'Aoste, La Thuile (Italy), Mar 1995). Order Number DE95011499. Source: OSTI; NTIS; INIS; GPO Dep.

We present an update of the top quark analysis using kinematic techniques in $p\bar{p}$ collisions at $\sqrt{s}$ = 1.8 TeV with the Collider Detector at Fermilab (CDF). We reported before on a study which used 19.3 pb^{-1} of data from the 1992–1993 collider run, but now we use a larger data sample of 67 pb^{-1}. First, we analyze the total transverse energy of the hard collision in W+$\geq$3 jet events, showing the likely presence of a $t\bar{t}$ component in the event sample. Next, we compare in more detail the kinematic structure of W+ $\geq$3 jet events with expectations for top pair production and with background processes, predominantly direct W+ jet production. We again find W+ $\geq$ 3 jet events which cannot be explained in terms of background, but show kinematic features as expected from top. These events also show evidence for beauty quarks, in agreement with expectations from top, but not compatible with expectations from backgrounds. The findings confirm the observation of top events made earlier in the data of the 1992–1993 collider run.

22582 (FNAL/C–95/062-E) **CDF results on $Z\gamma$ production.** Wagner, R.G. (Argonne National Lab., IL (United States)). CDF Collaboration. (ANL-HEP-CP–95-20; CONF-950287–3: International symposium on vector boson interactions, Los Angeles, CA (United States), 1-3 Feb 1995). Order Number DE95011500. Source: OSTI; NTIS; INIS; GPO Dep.

Results on Z_γ production observed by the Collider Detector at Fermilab (CDF) from the Tevatron Collider Run Ib and preliminary results from 36pb^{-1} of integrated luminosity from Run Ib. Both the Run Ia and Ib results are consistent with expectations from the Standard Model.

22583 (FNAL/C–95/095-E) **D0 search for new phenomena.** Eno, S. (Univ. of Maryland, College Park, MD (United States). Dept. of Physics). Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9503158–4: 30. Rencontres de Moriond on QCD and high energy interactions, Les Arcs (France), 19-26 Mar 1995). Order Number DE95013246. Source: OSTI; NTIS; INIS; GPO Dep.

D0 Collaboration.

Presented here are the results from three searches for non-standard model particles using approximately 13 pb^{-1} of data taken with the D0 detector at Fermilab's Tevatron, a $p\bar{p}$ collider operating at center-of-mass energy $\sqrt{s}$=1.8 TeV. A heavy right-handed W, predicted by left-right symmetric theories, is excluded at 95% confidence level with mass between 200 GeV/c^2 and 540 GeV/c^2, for a right-handed neutrino mass less than 100 GeV/c^2, regardless of the decay-properties of the neutrino, and assuming the W_R's couplings and C-K-M matrix are the same as the standard model W. Stricter limits are given on the right-handed neutrino mass for W_R masses near the upper limit, and for specific assumptions on the right-handed neutrino decay modes. A 95% confidence-level limit on the cross-section $p\bar{p} \rightarrow W_1Z_2 \rightarrow 3$ leptons, where $_1$, is the lightest supersymmetric partner of the charged vector bosom and charged higgs and Z_2 is the second lightest supersymmetric partner of the Z, γ, and neutral higgs, ranging from 3 pb for M_{W1}, =45 GeV/c^2 to 1 pb for M_{W1}=100 GeV/c^2 is presented, assuming mass relations between the supersymmetric particles predicted by a popular supergravity inspired model. Third, a 95% confidence-level limit on the mass of the supersymmetric partner of the gluon of 144 GeV/c^2, if the supersymmetric partner of the quarks are very heavy, or 212 GeV/c^2, if they have equal masses, is presented within the framework of the same popular model.

22584 (FNAL/C–95/102-E) **Observation of the top quark.** Klima, B. D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9503158–2: 30. Rencontres de Moriond on QCD and high energy interactions, Les Arcs (France), 19-26 Mar 1995). Order Number DE95013000. Source: OSTI; NTIS; GPO Dep.

The D0 collaboration reports on a search for the Standard Model top quark in $p\bar{p}$ collisions at $\sqrt{s}$ = 1.8 TeV at the Fermilab Tevatron, with an integrated luminosity of approximately 50 pb^{-1}. We have searched for $t\bar{t}$ production in the dilepton and single lepton decay channels, with and without tagging of b quark jets. We observe 17 events with an expected background of 3.8 $\pm$ 0.6 events. The probability for an upward fluctuation of the background to produce the observed signal is 2 $\times$ 10^{-6} (equivalent to 4.6 standard deviations). The kinematic properties of the excess events are consistent with top quark decay. We conclude that we have observed the top quark and measure its mass to be 199_{-21}^{+19} (stat.) $\pm$22 (syst.) GeV/c^2 and its production cross section to be 6.4 $\pm$ 2.2 pb.

22585 (FNAL/C–95/106-E) **Observation of the top quark.** Thompson, J. (Maryland Univ., College Park, MD (United States)). D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9503158–5: 30. Rencontres de Moriond on QCD and high energy interactions, Les Arcs (France), 19-26 Mar 1995). Order Number DE95013584. Source: OSTI; NTIS; INIS; GPO Dep.

The D0 collaboration reports on a search for the Standard Model top quark in $p\bar{p}$ collisions at $\sqrt{s}$ = 1.8 TeV at the Femilab Tevatron, with an integrated luminosity of approximately 50 pb^{-1}. We have searched for $t\bar{t}$ production in the dilepton and single-lepton decay channels, with and without tagging of b quark jets. We observe 17 events with an expected background of 3.8 $\pm$ 0.6 events. The probability for an upward fluctuation of the background to produce the observed signal is 2 δ 10^{-6} (equivalent to 4.6 standard deviations). The kinematic properties of the excess events are consistent with top quark decay. We conclude that we have observed the top quark and measure its mass to be 199_{-21}^{+19} (stat.) $\pm$22 (syst.) GeV/c^2 and its production cross section to be 6.4 $\pm$ 2.2 pb.

22586 (FNAL/C–95/133-E) **Charm production physics from Fermilab fixed-target experiments.** Gardner, R. (Illinois Univ., Urbana, IL (United States). Dept. of Physics). Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9503158–6: 30. Rencontres de Moriond on QCD and high energy interactions, Les Arcs (France), 19-26 Mar 1995). Order Number DE95013585. Source: OSTI; NTIS; INIS; GPO Dep.

Recent analyses of charm quark production mechanisms from Fermilab fixed-target experiments are summarized. Measurements of single inclusive differential cross sections for hadroproduced and photoproduced D mesons are compared to next-to-leading order QCD calculations. New data from hadroproduction and previous photoproduction measurements of charm meson pair correlations are compared to NLO calculations and also to parton shower Monte Carlo models. Nonperturbative effects, such as intrinsic k_t and fragmentation, are seen to play an important role in most of these comparisons. Results on charm production asymmetries in both hadroproduction and photoproduction are summarized.

22587 (FNAL/C–95/137-E) **Measurements of heavy quark production at D0.** Markosky, L. (Arizona Univ., Tucson, AZ (United States)). Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9503158–8: 30. Rencontres de Moriond on QCD and high energy interactions, Les Arcs (France), 19-26 Mar 1995). Order Number DE95013588. Source: OSTI; NTIS; INIS; GPO Dep.

We report measurements of the inclusive single muon and b-quark cross sections in $p\bar{p}$ collisions at $\sqrt{s}$ = 1.8 TeV using the D0

detector at the Fermilab collider, for the kinematic range $|yb| < 1.0$ and $P_t^b > 6$ GeV/c. We also report preliminary measurements on the J/ψ and Υ production cross sections.

22588 (FNAL/C–95116-E) **Jet shapes at D0 and CDF.** Streets, K.T. (New York Univ., NY (United States)). D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9503158–1: 30. Rencontres de Moriond on QCD and high energy interactions, Les Arcs (France), 19-26 Mar 1995). Order Number DE95012973. Source: OSTI; NTIS; INIS; GPO Dep.

The distribution of the transverse energy in jets has been measured in $p\bar{p}$ collisions at $\sqrt{s} = 1.8$ TeV at the Fermilab Tevatron collider using the CDF and DO detectors. This measurement of the jet shape is made as a function of jet transverse energy in both experiments and as a function of the jet pseudorapidity in the D0 experiment. Comparisons to Monte Carlo simulations and next-to-leading order partonic QCD calculations, $O(\alpha_s^3)$, are presented.

22589 (IC–95/50) **On the form factors of the $D^+_s \to \phi\ \mu^+\ \upsilon_\mu$ decay.** Hussain, F.; Ivanov, A.N.; Troitskaya, N.I. International Centre for Theoretical Physics, Trieste (Italy). May 1995. 7p. (Hepph–9505273.). Order Number DE95633989. Source: OSTI; NTIS (US Sales Only); INIS.

We apply the infinite mass effective theory, when a heavy quark mass tends to infinity, and Chiral perturbation theory at the quark level, based on the extended Nambu - Jona - Lasinio model with linear realization of chiral U(3) x U(3) symmetry, to calculate the form factors of the $D^+_s \to \phi\ \mu^+\ \upsilon_\mu$ decay up to the first order in current s - quark mass. The theoretical results are compared with experimental data and found to be in good agreement. (author). 12 refs.

22590 (INIS-RU–405) **IV. Workshop on High Energy Spin Physics.** Nurushev, S. (ed.). Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (In Russian, English). (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

In this proceedings the results on high energy spin physics are summarized. The theory of spin phenomenon and the experimental results at intermediate energy and at high energy spin physics and new technical developments in polarization experiments are presented.

22591 (INIS-RU–405, pp. 5-55) **Polarization experiments (review).** Nurushev, S.B. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics*. Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

The achievements both in theoretical physics and experimental techniques on polarization studies in a wide energy range have been reviewed. A programme on polarization studies for largest now available machines and those under construction is proposed. 20 refs.

22592 (INIS-RU–405, pp. 121-124) **Single spin asymmetry in inclusive meson production: What can learn from the high-energy large-X_F data?.** Ta-chung, M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics*. Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

Single-spin asymmetry in high-energy inclusive pion production processes using polarized proton and antiproton beams is discussed. Significant effects have been observed in the projectile fragmentation region. 6 refs.

22593 (INIS-RU–405, pp. 132-139) **Measuring the gluon polarization from Drell-Yan reactions at large transverse momentum.** Sridhar, K.; Leader, E. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics*. Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

The production of dimuon pairs at large transverse momentum via proton-proton collisions experiments where either the beam or the target is polarized is considered. 12 refs.

22594 (INIS-RU–405, pp. 140-144) **Quark-sea contribution to spin effects at high energies.** Goloskokov, S.V. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics*. Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of this report is the investigation of some non perturbation contributions to the spin-flip processes at high energies. However the simple rescattering on the spin-flip pomerons cannot explain the spin effects in large-angle scattering. 8 refs.

22595 (INIS-RU–405, pp. 148-163) **Structure functions of sea quarks, Kogut-Susskind pole and dynamics of pp- and pp-interactions at high energies.** Dorokhov, A.E. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics*. Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown that anomalous behaviour of the spin-dependent proton structure function is defined by the contribution to this structure function of a new Regge trajectory caused by Kogut-Susskid pole. 38 refs.; 5 figs.

22596 (INIS-RU–405, pp. 164-168) **Supercritical pomerons and spin in pp-scattering.** Martynov, E.S. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki). Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics*. Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

Spin amplitudes in elastic spin amplitudes in elastic pp(pp) scattering without crossing-odd contribution are considered. The account of multipomeron exchangers is performed. The spin properties of the pomerons are clarified. 11 refs.

22597 (INIS-RU–405, pp. 169-174) **Single-spin asymmetry in π+0 production by polarized antiprotons and protons.** Jenkovskij, L.L. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Teoreticheskoj Fiziki). Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics*. Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

Some implications of the spectacular results, collected recently on single-spin asymmetry in inclusive π+0 production by 200 GeV polarized protons and antiprotons at Fermilab. Specifically the observed oscillations in single-spin asymmetry are considered. 7 refs.

22598 (INIS-RU–405, pp. 175-190) **Spin effects in the elastic scattering of nucleons and new approach to problems of spin structure of hadrons.** Babbaev, Z.R.; Shchelkachev, A.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. Submitted to Zeitschrift fuer Physic. C, Particles and Fields.

The exclusive rare radiative B-decays are studied in the framework of the relativistic quark model based on the quasipotential approach in quantum field theory. The large recoil momentum of the final vector meson allows for the expansion of the decay form factor in inverse powers of the b-quark mass. This considerably simplifies the analysis of these decays. The $1/m_b$ expansion is carried out up to the second order. The form factor of $B \to K^*\gamma$ decay is found to be $F_1^{B\to K^*\gamma}(0)=0.32\pm0.03$ and it leads to $BR(B \to K^*\gamma)=(4.5 \pm 1.5) \times 10^{-5}$, which is in agreement with the recent CLEO data. The form factors of the decays $B \to \rho\gamma$, $B_s \to \phi\gamma$ and $B_s \to K^*\gamma$ are also considered. The relation between rare radiative and semileptonic B-decays into light vector mesons is discussed. 33 refs., 2 figs., 1 tab.

Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. DOE Contract AC03-76SF00515. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

The authors considers the production of τ pairs by electron-positron colliding beams at the maximum cross section near the

threshold. At this energy τ pairs are produced mostly in the s-wave which implies that the spin of the τ pairs are almost always pointing in the beam direction independent of the production angle. When both electrons and positrons are longitudinally polarized in the same direction, for example 90%, one can obtain τ pairs with 99% polarization in the direction of the polarization vectors of the incident beams. Tests of CP violation and study of the structure of weak interactions using such polarized τ pairs are discussed.

Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

Charmonium physics is uniquely possible in a tau charm factory. The expected increase in data samples is a factor 100-1000 over current experiments. The physics potential and opportunities are (1) In gluonium physics, search for a bound state of 2 or more gluons by careful spin parity analysis of states produced in radiative J/Ψ decays. (2) In Ψ' decays, there are many charmonium measurements which currently are either poorly measured or non-existent. These include the two and three photon width of the η_C and J/Ψ, the discovery of the η'_c, the measurement of the hadronic decays of the χ_c and the normalization of the $p\bar{p}$ decays of the charmonium states observed by E760. (3) Further progress in understanding the hadronic Ψ' decays require a large statistics sample to measure the pattern of hadronic decays. A careful comparison to the J/Ψ hadronic decays should clarify this puzzle. The ultra high rate of the J/Ψ decays permits the possibility of high statistics study of light quark mesons. It appears a tau charm factory could contribute many branching ratio measurements. Finally, the ultra high rates of the J/Ψ and Ψ' decays permits a careful study of the detector acceptances which will be necessary to make further progress in tau and charm physics.

This paper is an introduction to the Tau Charm Factory workshop. To establish a firm scientific basis for future Tau Charm Factory plans one has to address the following two questions: (1) To what extent can and will work at other machines cover work that a Tau Charm Factory could do? Conversely (2) What are the required minimum parameters of a Tau Charm Factory which can do unique physics five years hence and beyond? This workshop has been organized to generate some preliminary answers in response to these two questions. Thus this Workshop is neither simply a scientific Workshop on the one hand or a planning session for specific machines on the other; rather it is something in between. During the workshop, specific plans or proposals for a Tau Charm Factory will be presented, but no attempt will be made to arrive at a consensus in response to such plans.

22634 (SLAC–451, pp. 184-205) **Charm physics – The theory case for a new generation of experiments.** Bigi, I.I. (Univ. of Notre Dame, IN (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

The author discusses charm decays, lifetimes, and branching ratios, in terms of what is known today, by theory and experiment, and what could be learned from a new facility. A Tau Charm Factory will allow the advantage of lower standard model backgrounds in looking at charm particle decays. Questions the author feels are open include lifetimes of B, Λ, and Ξ particles, their branching ratios in SL and NL decays, and rare decay modes. Also the possibility to study D^0-$\bar{D}^0$ oscillations, and studies of CP violation effects. The author argues the primary purpose of such a facility would allow study of QCD in novel environments under controlled laboratory conditions. One can study charm and lepton decays, charmonium spectroscopy, and light quark/gluonia spectroscopy. In addition the facility opens the possibility of finding new physics in any of these systems.

22635 (SLAC–451, pp. 206-232) **Using charm to probe new physics.** Hewett, J.L. (Stanford Linear Accelerator Center, CA (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

The author discusses new physics results which can be derived from detailed studies in the area of charm decays. A number of different models can be tested with such results, including the standard model, extended Higgs sector models, models which propose additional Q=−1/3 quarks, supersymmetry, left-right symmetric models, techni-color/composite models, and family symmetries. Processes which can be studied to test such models include D^0-$\bar{D}^0$ mixing, rare decays of D particles, CP violations, and assymetries in Z decays. Standard model loop corrections tend to be small in charmed particle systems, so long distance effects can dominate, and thus charm systems provide a good place to look for new physics. Unconventional models give the largest contributions in systems not tested when looking at K and B particle systems.

22636 (SLAC–451, pp. 233-292) **Charmed baryons and spectroscopy at CLEO II.** Besson, D. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

The author discusses charmed baryon physics and spectroscopy which has been studied at CLEO II. Discussed are charmed baryon studies at CESR, including absolute decay rates for Λ_c, Ξ_c^+, and Ξ_c^0, inclusive rates for $\Lambda_c \rightarrow \Lambda + X$, studies of exchange in Λ and Ξ decays, studies of $c \rightarrow s$ transitions in baryons, and production in e^+e^- collisions. Also discussed are meson spectroscopy results, including precision splittings in the D and D^* system, and mass measurements in the excited D meson family. Also discussed are charmed baryon spectroscopy at CLEO II, including masses and widths of Σ_c and Λ_c states.

22637 (SLAC–451, pp. 293-334) **Charm meson decays at CESR.** Yamamoto, H. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

The author discusses a number of different topics. First is the question of where CESR will be in the year 2000, in terms of luminosity and its detector, and the impact of this on charm physics. Also what has been learned of semileptonic decays of D^0, D^+, D_s, and Cabbibo-favored/suppressed decays. Studies of hadronic decays, Cabbibo-favored/suppressed, rare decays, mixing, and CP invariance. What role can a Tau Charm Factory play in this type of physics, and what can it tell us beyond what we can reach at present.

22638 (SLAC–451, pp. 335-389) **Fermilab fixed target charm program.** Cumalat, J. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

The author discusses two upcoming fixed target experiments at Fermilab, which will provide upwards to 1 million reconstructed events in the charmed systems. The projections for experiment E831, a photoproduction experiment scheduled for 1996 to 1997 time frame, and E781, involving a hadron beam, are discussed in

light of earlier fixed target experiments which have yielded charm particle results. These experiments are aimed at precision lifetime measurements for Λ_c^+, $\Xi_c^{+,0}$, and Ω_c^0, and study of semileptonic decays of baryons. They also aim to study D^0-$\bar{D}^0$ mixing and suppressed Cabbibo decays, to measure absolute branching ratios, and to study semileptonic decays of D mesons.

22639 (SLAC–451, pp. 492-504) **Charmonium physics in a Tau Charm Factory.** Gu, Yifan (Institute of High Energy Physics, Beijing (China)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

The present status of the charmonium system is reviewed. Emphasis is placed on the following issues: the hadronic decay puzzle; search for the vector glueball; confirmation of the $\eta_c(2S)$ and hc1 states; the χ_c physics. The possibilities at a future Tau Charm Factory are discussed.

22640 (SLAC–451, pp. 535-553) **Charmonium and J/Ψ physics.** Toki, W. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

Scalar Glueball or non-$q\bar{q}$ particle searchers are most interesting, however it has been problematic. Clear cut spin-parity tests are difficult. Advances may come from unexpected discoveries. Much of Charmonium is either not measured or poorly measured. Many measurements would be complementary to E760 and LEAR. Hadronic J/Ψ and Ψ′ decays might contribute to a study of rescattering effects which is important for CP violation measurements. J/Ψ and Ψ′ decays for detector checks and cross checks of BR measurements will be invaluable for high precision measurements of BR's, angular distributions and charge conjugation tests.

22641 (SLAC–451, pp. 554-592) **Monte Carlo Study of a Tau-Charm Factory.** Fan, Xiaoling. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

Monte Carlo study of Tau-Charm Factory has been seriously done by τcF team working at CERN and Spain. In order to prepare a specific proposal for a Tau-Charm Factory construction in Beijing, a Monte Carlo group in IHEP was set up in May 1994 to study the physics goals of Tau-Charm Factory. In the authors' Monte Carlo simulation, a simple MC frame was constructed. We did not consider the detailed structure of detector, events are generated by MC generators, then the track parameters are smeared according to the detector performances which are completely based on the talk presented at the Third Workshop on the Tau-Charm Factory by Professor Jasper Kirkby.

22642 (SLAC–451, pp. 616-682) **Tau physics at LEP: Status and potential.** Harton, J. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

The author discusses the performance of LEP in 1994 as far as tau production is concerned. He projects the lifetime performance of LEP for tau physics results. He then discusses what has been learned from studies of tau decays. Michel parameters, lifetimes and branching ratios to leptonic decays, and to final states with hadrons and kaons along with neutrinos and other particles. Strong coupling constants are also discussed.

22643 (SLAC–451, pp. 683-719) **The TAO of the τ with CLEO II.** Besson, D. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

The author provides a review of tau physics results derived from CLEO. In a broad manner he touches on measurement of the tau mass and neutrino mass, as well as the lifetime. He discusses studies of leptonic decay of the tau, in terms of precision tests for the Standard Model, and tests of the Lorentz structure, V-A and weak current parameters.

22644 (SSCL-Preprint–160) **Trigger and DAQ issues in low-mass Higgs searches.** Wang, E.M.; Botlo, M.; Dorenbosch, J.; Walbran, S. Superconducting Super Collider Lab., Dallas, TX (United States). Oct 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011103. Source: OSTI; NTIS; INIS; GPO Dep.

Results from ongoing trigger and DAQ studies at the Superconducting Super Collider Laboratory are presented. Specific Higgs decay modes are identified, calorimetric triggering algorithms are examined, and implications for data acquisition are discussed.

22645 (SSCL-Preprint–480) **Exploiting the single-lepton event structure in the search for the top quark.** Cobal, M. (Istituto Nazionale di Fisica Nucleare, Pisa (Italy)); Leone, S.; Grassman, H. Superconducting Super Collider Lab., Dallas, TX (United States). Jun 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011136. Source: OSTI; NTIS; INIS; GPO Dep.

We discuss whether the event structure can be useful in searching for the top quark in the single-lepton channel at the Tevatron, where the main obstacle is a considerable background from QCD W+ multijet production. We restrict our discussion to the case of a Standard Model top quark of heavy mass, $M_{top} > 100$ GeV.

6624 Properties of Specific Particles and Resonances

22646 (BNL–61419) **The Brookhaven muon g-2 experiment.** Bunce, G. Brookhaven National Lab., Upton, NY (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9509101–1: 8. international symposium on polarized phenomena in nuclear physics (SPIN 94), Bloomington, IN (United States), 15-22 Sep 1995). Order Number DE95007676. Source: OSTI; NTIS; INIS; GPO Dep.

A new experiment is being mounted at BNL to measure the anomalous magnet moment of the muon to 3 parts in 10^7. In this talk I will describe the physics issues that this precision allows us to explore, the experimental method, and an interesting new device which we will use to inject muons into our muon storage ring. The device is a 1.45T non-ferrous superconducting magnet, where all fringe field is contained by a superconducting sheet.

22647 (DOE/ER/40561–188) **Wee partons in large nuclei: From virtual dream to hard reality.** Venugopalan, R. Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory. [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER40561. (CONF-950127–7: 11. international conference on ultra-relativistic nucleus-nucleus collisions, Monterey, CA (United States), 9-13 Jan 1995). Order Number DE95012168. Source: OSTI; NTIS; INIS; GPO Dep.

We construct a weak coupling, many body theory to compute parton distributions in large nuclei for $x \ll A^{-1/3}$. The wee partons are highly coherent, non-Abelian Weizsaecker-Williams fields. Radiative corrections to the classical results axe discussed. The parton distributions for a single nucleus provide the initial conditions for the dynamical evolution of matter formed in ultrarelativistic nuclear collisions.

22648 (FNAL/C–95/049) **Excited charmed mesons.** Butler, J.N.; Shukla, S. Fermi National Accelerator Lab., Batavia, IL

(United States). May 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950285–3: LAFEX international school in high energy physics, Rio de Janeiro (Brazil), 20 Feb 1995). Order Number DE95013245. Source: OSTI; NTIS; INIS; GPO Dep.

The experimental status of excited charmed mesons is reviewed and is compared to theoretical expectations. Six states have been observed and their properties are consistent with those predicted for excited charmed states with orbital angular momentum equal to one.

22649 (INIS-RU–405, pp. 67-99) **Experimental study of gluon polarization at UNK. (Physical project of the first stage of POLEX programme).** Akimenko, S.A. (and others); Arestov, Yu.I.; Belikov, N.I. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (In Russian). (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics.* Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

The experiment carrying out at UNK on the measurement of two-spin asymmetry in production of hidden charm particles X (3555) and J/Ψ (3100) and direct γ-quanta is discussed. At the first stage of POLEX programme at UNK it is suggested to receive the information on gluon density function, depending on spin. 28 refs.; 15 figs.

22650 (INIS-RU–405, pp. 100-111) **Theoretical interpretation of polarized leptoproduction data.** Efremov, A. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics.* Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

The role of quarks and gluon in polarized leptoproduction in connection with the famous EMC experimental result is examined. The role of the ghost contribution in the generalized Goldberger-Treiman relation is emphasized. 35 refs.

22651 (INIS-RU–405, pp. 112-120) **Orbiting quarks in polarized protons.** Ta-chung, M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics.* Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

The question of existing the orbiting constituents in polarized hadrons is discussed and answered in the affirmative. Theoretical arguments and experimental evidence which have led to this conclusion are summarized in talk. 15 refs.

22652 (INIS-RU–405, pp. 125-131) **Testing proton spin models with polarized beams.** Ramsey, G. (Loyola Univ., Chicago, IL (United States). Dept. of Physics). Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics.* Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

Models for spin-weighted parton distributions in a proton have been constructed. The quark contributions in different processes have been distinguished by defining the valence and sea quark (antiquark spin weighted distributions separately). These are discussed with polarized beam experiments at energies typical of Fermilab, CERN and UNK. 13 refs.

22659 (SLAC–451, pp. 69-94) **TAU Lepton physics at a Tau-Charm Factory.** Perl, M.L. (Stanford Univ., CA (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. DOE Contract AC03-76SF00515. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

A two-day workshop, "The Tau-Charm Factory in the Era of B-factories and CESR," was held at SLAC in August, 1994. This paper summaries the important research on the tau lepton which could be done at a tau-charm factory in the next decade. It is based on the presentations by the speakers and on the discussion by participants, as well as on published papers.

22660 (SLAC–451, pp. 156-183) **Physics prospects at the Tau-Charm Factory.** Huang, T. (IHEP, Beijing (China)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

In this talk the author summarizes results which have come from the Beijing Electron Positron Collider (BEPC) up to this point in comparison with results from other machines in operations today. He also points out the advantages offered by a new machine tailored as a Tau Charm Factory, where advantage can be taken of resonanaces and threshold phenomena to achieve better accuracy in measurements, and to minimize problems of systematic errors. Physics results which can be addressed in gluonium and hybrid states, in the study of tau particles and its neutrinos, and in the study of charm physics, are discussed.

22661 (SLAC–451, pp. 505-534) **Some important questions in charmonium physics.** Seth, K. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

This paper is devoted to three propositions: (1) Some of the most basic questions in heavy-quark physics remain unanswered; (2) Charmonium physics is the best place to address those questions at the required level of precision; (3) A tau-charm factory, with a commensurate state-of-the-art detector, are mandatory for doing the job. While open-charm and tau physics will certainly be done at beauty factories, charmonium physics will not. It must, therefore, form an important part of the physics program at a tau charm factory. With this as an introduction, the author then reviews the status of charmonium studies at this point, and ongoing work, with its projected weaknesses.

22662 (SLAC–451, pp. 720-743) **τ universality and precision measurements.** Rizzo, T. (Stanford Linear Accelerator Center, CA (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper the author discusses the issue of universality with respect to the tau particle. Present work is trying to attack this by looking at $\tau\nu_\tau W$ and $Z\tau\bar{\tau}$ couplings. Some models predict that non-universality will be such a small effect that it may be only tractable with a device such as a tau-charm factory. The issue of universality has impacts in other electroweak reactions, and in many models. The observation of such effects may require very high luminosity however.

22663 (SSCL-Preprint–116) **Potential motion for Thomas-Fermi non-topological solitons.** Bahcall, S. (Stanford Univ., CA (United States). Dept. of Physics); Lynn, B.W. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1992. 4p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC35-89ER40486. NSF-PHY-8917438. (SU-ITP–92/14). Order Number DE95011212. Source: OSTI; NTIS; INIS; GPO Dep.

In the Thomas-Fermi approximation to theories of coupled fermions and scalars, the equations for spherically-symmetric non-topological solitons have the form of potential motion. This gives a straightforward method for proving the existence of non-topological solitons in a given theory and for finding the constant-density, saturating solutions.

22664 (SSCL-Preprint–167) **On constraints for heavy-meson form factors.** Grinstein, B. (Superconducting Super Collider Lab., Dallas, TX (United States)); Mende, P.F. Superconducting Super Collider Lab., Dallas, TX (United States). Nov 1992. 11p. Sponsored by USDOE, Washington, DC (United States);Sloan (Alfred P.) Foundation, New York, NY (United States). DOE Contract AC35-89ER40486 ; AC02-76ER03130. Order Number DE95011105. Source: OSTI; NTIS; INIS; GPO Dep.

We examine the recent work of de Rafael and Taron where model-independent bounds on the Isgur-Wise function are presented. We first argue that the bounds cannot hold in as much generality as implied. We show that the effects of resonances omitted in their discussion (such as heavy-heavy "onium" states below threshold) modify the bound. The resulting bound is much weaker but may be useful where the size of the additional contribution may be computed or estimated.

22665 (SSCL-Preprint–544) **Exact heavy to light meson form factors in the combined heavy quark, large N_c and chiral limits.** Grinstein, B. (Superconducting Super Collider Lab., Dallas, TX (United States)); Mende, P. Superconducting Super Collider Lab., Dallas, TX (United States). Dec 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486 ; AC02-76ER03130. Order Number DE95011030. Source: OSTI; NTIS; INIS; GPO Dep.

We demonstrate that the form factors of local operators between a heavy meson state (like the B) and a light pseudoscalar state (like the pion) are given exactly by a single pole form in the combined heavy quark, large N_c (number of colors) and chiral limits. We discuss the deviations from this exact result from finite heavy quark masses, non-zero light quark masses and finite N_c. We comment on some of the numerous implications of this result.

Recently discovered metastable antiprotonic helium atoms have provided a new play ground for high precision spectroscopy of exotic atoms involving antiprotons. The structure, formation and decay of large (n,l) states of p-barHe$^+$ atoms have been studied from delayed antiproton annihilation spectra, and laser resonance spectroscopy has also been established. The present status and future perspectives of this new spectroscopy are reviewed. (author).

Source: OSTI; NTIS (US Sales Only); INIS.

The effect of nuclear friction on the line form of the electromagnetic radiation generated by surface oscillations of heated spherical nuclei and on the initial state decay law is investigated. It is shown that the decay law differs from the exponential law, the line has the Lorentz form and its width is equal to the sum of the natural width and the friction coefficient. 10 refs.

22690 (ANL/PHY/PP–83708) **A-dependence of nuclear transparency in quasielastic A(e,e'p) at high Q^2.** O'Neill, T.G. (California Institute of Technology, Pasadena, CA (United States). W.K. Kellogg Radiation Lab.); Lorenzon, W.; Arrington, J. Argonne National Lab., IL (United States). 1 May 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95012220. Source: OSTI; NTIS; INIS; GPO Dep.

The A-dependence of the quasielastic A(e,e'p) reaction has been studied with ^{3}H, C, Fe, and Au nuclei at momentum transfers Q^2 = 1, 3, 5, and 6.8(GeV/c)^2. The authors extract the nuclear transparency T(A,Q^2), a measure of the average probability of escape of a proton from a nucleus A. Several calculations predict a significant increase in T with momentum transfer, a phenomenon known as color transparency. No statistically significant rise is seen for any of the nuclei studied.

22691 (BNL–61515) **Scaling between K^+ and proton production in nucleus-nucleus collisions.** Chen, Ziping; Chasman, C. Brookhaven National Lab., Upton, NY (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950127–9: 11. international

conference on ultra-relativistic nucleus-nucleus collisions, Monterey, CA (United States), 9-13 Jan 1995). Order Number DE95008863. Source: OSTI; NTIS; INIS; GPO Dep.

An empirical scaling involving the production of strange particle K^+ and protons has been observed at each rapidity over a large range covered by the E-802 spectrometer in reactions from minimum biased p+Be to central Si+Au at 14.6 A-GeV/c. This scaling has implications for the temporal evolution in nucleus-nucleus collisions.

22692 (BNL–61518) **Hadron distributions at higher rapidity using the BRAHMS forward spectrometer.** Moskowitz, B. Brookhaven National Lab., Upton, NY (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950127–10: 11. international conference on ultra-relativistic nucleus-nucleus collisions, Monterey, CA (United States), 9-13 Jan 1995). Order Number DE95008861. Source: OSTI; NTIS; INIS; GPO Dep.

Different conditions, and therefore different physics, are expected to exist over the range of rapidities at RHIC. The BRAHMS Forward Spectrometer will measure identified hadron distributions up to $y \approx 4$, giving it a unique place in the RHIC experimental program.

22693 (BNL–61523) **Recent results from E866.** Videbaek, F. E802 Collaboration. Brookhaven National Lab., Upton, NY (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950127–8: 11. international conference on ultra-relativistic nucleus-nucleus collisions, Monterey, CA (United States), 9-13 Jan 1995). Order Number DE95008857. Source: OSTI; NTIS; INIS; GPO Dep.

The E866 experimental setup has been upgraded by addition of a forward spectrometer to handle the large multiplicities in central Au+Au collisions at AGS. Furthermore new global detectors have been added to gain insight into the reaction dynamics and enable studies of flow effects. The report presents preliminary rapidity distributions for protons and produced mesons in central collisions. The shape of m_t-spectra of pions is discussed. Examples of the measurements which can be done with a new multiplicity array are presented.

22694 (BNL–61525) **Is there flow at the AGS?.** Wessels, J.P.; Zhang, Yingchao. E877 Collaboration. State Univ. of New York, Stony Brook, NY (United States). Dept. of Physics. [1994]. 8p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States);Natural Sciences and Engineering Research Council of Canada, Ottawa, ON (Canada). DOE Contract AC02-76CH00016. (CONF-940169–12: 10. winter workshop on nuclear dynamics, Snowbird, UT (United States), 15-21 Jan 1994). Order Number DE95008866. Source: OSTI; NTIS; INIS; GPO Dep.

We have employed the nearly 4π-calorimetric coverage of the E877 apparatus in order to determine flow in different regions of pseudo-rapidity from the measured transverse energy in Au+Au collisions at 11.4 A·GeV/c. Signatures for the side-splash in the reaction plane at forward and backward rapidities have been established. Indications of a non-zero eccentricity of particles in the reaction plane at mid-rapidity are also found. These observations complement analyses deriving collective longitudinal motion from dN/dy-spectra of protons, kaons, and pions as well as collective transverse motion of the same particles from m_t-spectra at midrapidity.

22695 (BNL–61650) **The measurement of nuclear medium effects with K^+.** Piasetzky, E. (Tel Aviv Univ. (Israel). Sackler Faculty of Exact Sciences). Brookhaven National Lab., Upton, NY (United States). Aug 1994. 7p. Sponsored by USDOE, Washington, DC (United States);United States-Israel Binational Science Foundation, Jerusalem (Israel). DOE Contract AC02-76CH00016. (CONF-9403225–1: International symposium on medium energy physics, Beijing (China), Mar 1994). Order Number DE95010448. Source: OSTI; NTIS; INIS; GPO Dep.

The total cross sections for K^+ mesons on deuterium and several N=Z nuclei have been measured at several momenta in the range 450–740 MeV/c. The characteristics of the K^+ N interaction make the K^+ an ideal tool for probing the nuclear volume to reveal nuclear medium effects. Measurements of the ratio of the total cross sections per nucleon of $K^+ - A$ to $K^+ d$ are found to lie significantly above those predicted by the usual nuclear medium corrections. This suggests that novel phenomena have been neglected. Models which incorporate such phenomena are discussed, including nucleon 'swelling,' mass rescaling, nuclear pions and relativistic effects.

22696 (CONF-9402139–1) **Stochastic approaches to dynamics of heavy ion collisions, the case of thermal fission.** Boilley, D. (Kyoto Univ. (Japan). Yukawa Inst. for Theoretical Physics); Abe, Y.; Suraud, E.; Ayik, S. Tennessee Technological Univ., Cookeville, TN (United States). 30 Mar 1994. 12p. Sponsored by USDOE, Washington, DC (United States);Japan Society for the Promotion of Science, Tokyo (Japan). DOE Contract FG05-89ER40530. From RIKEN symposium on nuclear dynamics at finite temperature; Tokyo (Japan); Feb 1994. Order Number DE95013488. Source: OSTI; NTIS; INIS; GPO Dep.

In order to study the influence of fluctuations on various phenomena linked to heavy ion collisions, a Langevin equation has been derived from a microscopic model. Parameters entering this equation are completely determined from microscopic quantities characterizing nuclear matter. This equation has been applied to various phenomena at intermediate energies. This paper focuses on large amplitude motions and especially thermal fission. Fission rate is calculated and compared to experimental results.

22697 (DOE/ER/40293–9) **Nuclear structure studies via neutron interactions. Progress report, 1 July 1994–30 June 1995.** Carlton, R.F. Middle Tennessee State Univ., Murfreesboro, TN (United States). Jan 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-86ER40293. Order Number DE95012166. Source: OSTI; NTIS; INIS; GPO Dep.

Neutron total cross section measurements of ^{122}Sn has been analyzed over the energy range 0.013 to 0.310 MeV. The R - matrix analysis has resulted in resonance and average parameters which provide for a complete representation of the neutron entrance the $s_{1/2}$, $p_{1/2}$, and $p_{3/2}$ contributions. The s - and p - neutron strength functions have been determined to be 0.123 ± 0.023 and 2.0 ± 0.200, respectively (in units of 10^{-4}). Limits are placed on level spacings and strength functions for the individual partial wave components. The s - wave potential scattering radius has been determined to be 6.3 ± 0.1 fm. Average scattering functions, deduced from the average parameters, have been used to determine the real well depth of an optical model potential which reproduces these functions. We find, as have others, that the real well depth is parity dependent. Two computer codes were developed: (1) a minimization program for finding parameters of a dispersive optical model which reproduce the high resolution data of the ORELA facility, and (2) an X-windows graphical user interface has been developed to permit interactive resonance analysis of the neutron total cross section data using analysis-and-minimization codes developed previously. These will contribute to the more routine analysis of ORELA data.

22698 (DOE/ER/40702–9) **A cross section measurement of charm hyperons Ξ_c^+ and Ξ_c^0 in 250 GeV p/K/π-nucleon interactions.** Francisco, J.; Vergara, A. Tufts Univ., Medford, MA (United States). Dept. of Physics and Astronomy. 2 May 1995. 103p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER40702. Order Number DE95013071. Source: OSTI; NTIS; INIS; GPO Dep.

Fermilab Experiment 769 used a charge-selected, hadron beam of mean energy 250 GeV/c, composed of pions, kaons, and protons, impinging on beryllium, aluminum, copper and tungsten targets. Using a sample of approximately 4000 $\Xi_c^- \rightarrow \Lambda^0\pi^-$ decays, measurements of the charm baryon forward cross sections times branching ratio $\pi^{\pm}N \rightarrow \Xi_c^+X$ and $\pi^{\pm}N \rightarrow \Xi_c^0X$ are presented. Upper limits on α x BR are also determined for the states $\Xi_c^+ \rightarrow \Xi_c^-\pi^+\pi^+$ and $\Xi_c^0 \rightarrow \Xi_c^-\pi^+$ produced in (p, π^+, π^-, K^+, K^-)-nucleon interactions.

22699 (DOE/ER/40808–T1) **Low energy proton capture in light nuclei. Progress report, September 1, 1993–June 8, 1994.** Prior, R.M. West Georgia Coll., Carrollton, GA (United States). Dept. of Physics. [1995]. 9p. Sponsored by USDOE, Washington,

DC (United States). DOE Contract FG05-93ER40808. Order Number DE95012197. Source: OSTI; NTIS; INIS; GPO Dep.

Radiative capture reactions with light nuclei are of special interest in nuclear astrophysics because of their importance in the formation of the various elements. In many cases a simple direct-capture model that considers only the electromagnetic interaction is sufficient to reproduce experimental results. A direct-semidirect process may be used in which the transition amplitude is the sum of a direct term and another term representing the excitation of the target nucleus into a collective state. In cases where these approaches are not sufficient, the relative simplicity of nuclear systems with small numbers of fundamental particles allows microscopic calculations of measurable quantities from nucleon-nucleon potentials, using the multichannel resonating group model or, in some cases, Faddeev calculations. In the summer of 1990, the PI began a collaboration with Professor Henry Weller's group at the Triangle Universities Nuclear Laboratory (TUNL). Weller's group has studied radiative capture reactions with polarized beams at TUNL for over a decade, developing considerable expertise in the detection of high energy gamma rays and for the analysis of the measurements. The PI has been involved in the development of a new series of experiments at beam energies below 100 keV, using the positive beam directly from the high intensity atomic beam polarized ion source. This work is the topic of the present grant, which began September 1, 1993. The main activity in the grant occurs during the summer months. Since this is the first year of the grant, most of that activity will be during the upcoming summer months. The PI will travel to TUNL in mid-June and will spend most of his time from then through August either at TUNL or working on data reduction and other calculations at West Georgia College. The PI is moving from West Georgia College (WGC) to North Georgia College (NGC) in September, 1994. He will be Professor and Chair of Physics there as he has been at WGC.

22700 (FEI–2381) **Application of optical potential theory for calculation of nucleon cross sections.** Avdeenkov, A.V.; Kamerdzhiev, S.P. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 25p. (In Russian). Order Number DE95634124. Source: OSTI; NTIS (US Sales Only); INIS.

In order to calculate cross sections more reliably, application of the Green function method to the calculation of the optical nucleon potential V_{opt} is treated. A semi-microscopic approach for calculation of V_{opt} based on using the available theoretical information about the mass operator and the known phenomenological V_{opt} is proposed. The main part of Im V_{opt} for neutrons with $E_n<10$ MeV as well as the absorption cross section for s- and p-neutron for ^{208}Pb have been calculated. Several variants to improve the available calculations of V_{opt} and, therefore, cross sections including those for non-magic and hot nuclei are proposed. 29 refs.; 5 figs.

22701 (FEI–2390) **Effect of nuclear level density on the calculation of excitation function for production of cesium, xenon, iodine, thallium, lead and bismuth radionuclides.** Kurenkov, N.V.; Lunev, V.P.; Shubin, Yu.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 52p. (In Russian). Order Number DE95634109. Source: OSTI; NTIS (US Sales Only); INIS.

Excitation functions for the production of radionuclides Cs, Xe, I, Pb, Tl, Bi and some others for charged particle energies ranging from 5-100 MeV have been calculated. The well known experimental results have been compared to excitation functions calculated by two versions of the most widely used computer code ALICE. The generalized superfluid model of nuclei was used for level density description. The results of calculation for the ALICE-87 and ALICE-92 codes are discussed. Modified ALICE-92 code takes into account γ-ray competition, as well as cluster's preequilibrium emission. 43 refs.; 29 figs.; 3 tabs.

22702 (FEI–2402) **Analysis of threshold anomaly in elastic and inelastic proton scattering.** Gurbich, A.F.; Titarenko, N.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 12p. (In Russian). Order Number DE95634125. Source: OSTI; NTIS (US Sales Only); INIS.

Numerical experiments have been performed with aim to reveal the influence of channel coupling and peculiarities of the real optical potential formfactor on the experimentally obtainable values. High sensitivity of the inelastic scattering cross section to the detailed structure of the real potential well is shown. Effects of the channel coupling have not been revealed. 18 refs.; 5 figs.; 1 tab.

22703 (INIS-RU–405, pp. 144-147) **Polarization effects in diffractive disintegration of relativistic deuterons.** Rekalo, M.P.; Gakh, G.I. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics.* Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

Deuteron diffractive dissociation is investigated. for extracting information on the deuteron structure and for determination of behaviour of S and D-components of the deuteron wave function at short distances. The dynamics of the deuteron diffractive disintegration is described in terms of Feynman diagrams treated relativistically, when the nucleons are described by the four-components Dirac spinors and deuteron is by the polarization 4-vector. 5 figs.

22704 (INIS-RU–405, pp. 214-216) **Rotation and spin oscillation of high-energy particles in target with polarized nuclei and possibility of measurement of spin-dependent part amplitude of coherent elastic forward scattering.** Baryshevskij, V.G. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (In Russian). (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics.* Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

For measurement of spin-dependent amplitude of coherent elastic scattering of slow neutrons by nucleus at zero angle the nuclear precession of neutron spin in matter with polarized nuclei is used. 7 refs.

22705 (INIS-RU–405, pp. 288-290) **The p$_t$-dependence of asymmetry in inclusive π^0-production in the beam fragmentation region at 40 GeV.** Apokin, V.D. (and others); belikov, N.I.; Chujko, B.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics.* Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

The π^0-meson asymmetry measured in the reactions is presented. The asymmetry unpolarized beam fragmentation region at intermediate was measured for the first time. 11 refs.

22706 (INIS-RU–405, pp. 329-332) **The vector analyzing power 1 T_{11} in the π^+d->pp reaction in the energy region 350-450 MeV.** Bazhanov, N.A. (and others); Efimovich, V.A.; Fedorov, O.Ya. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics*. Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

Dependences of the azimuthal and target asymmetries in the break-up polarized deuterons by unpolarized deuterons on the choice of deuteron EM. Results of the calculations are compared with available data. 4 refs.

22709 (INIS-RU–405, pp. 346-348) **Mechanism of the ^{2}He breakup by linearly polarized photons.** Kotyar, V.V.; Shebeko, A.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics*. Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

In this report the effects of the two-body photoabsorption mechanism generated by the ρ-meson exchange are demonstrated against the background of contributions arising from the convection current, the magnetic current and π-EC. 16 refs.

22710 (INIS-RU–405, pp. 349-352) **Elastic p-^{4}He scattering at intermediate energies.** Manaenkov, S. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics*. Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper the description of an elastic p-^{4}He scattering with NN-amplitudes obtained in the phase shift analysis and realistic wave functions are given. 8 refs.

22711 (INIS-RU–405, pp. 353-358) **The prospect of experimental study an analysing power of polarized proton scattering on carbon.** Belzer, L.I. (and others); Bodyagin, V.A.; Gribushin, A.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics*. Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

Data on analyzing power of polarized proton scattering on carbon at the energies 1-3 GeV are obtained for first time. 11 refs.

22712 (INIS-RU–405, pp. 359-362) **Elastic and inelastic electron scattering on polarized deuterons.** Vojtsekhovskij, B.B. (and others); Nishnev, V.I.; Nikolaenko, D.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 460p. (In Russian). (CONF-9109331–: 4. workshop on high energy spin physics, Protvino (USSR), 3 Sep 1991). In *IV. Workshop on High Energy Spin Physics*. Order Number DE95632424. Source: OSTI; NTIS (US Sales Only); INIS.

On VEPP-3 storage rings in Novosibirsk the experiments on electron scattering on polarized deuterons has been set up. The experiment at high momentum transfer has been developed. 3 refs.

22713 (INS–1082) **Nucleosynthesis in explosive hydrogen burning process.** Kubono, Shigeru. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Dec 1994. 9p. Order Number DE95780480. Source: OSTI; NTIS; INIS.

Some experimental studies of light, proton-rich unstable nuclei have been performed to investigate the onset mechanism of the rapid-proton process including the breakout processes from the Hot-CNO cycle and also from the NeNa cycle. A new experimental result on the Ne-E problem is also discussed. The INS project is briefly reported that uses radioactive nuclear beams for nuclear astrophysics. (author).

22714 (INS–1083) **Recent development in experimental nuclear astrophysics.** Kubono, S. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Dec 1994. 11p. Order Number DE95780481. Source: OSTI; NTIS; INIS.

Some critical nuclear reactions in nuclear astrophysics are discussed. They include the problems in primordial nucleosynthesis, the solar neutrino problem, ^{16}O synthesis in He burning, and the explosive hydrogen burning process. Specifically, astrophysical nuclear reactions which involve clusters and unstable nuclei are emphasized. The scope of the field is also discussed. (author) 64 refs.

22715 (JAERI-Tech–95-004) **Calculation of air activation in an electron linac facility using the EGS4 code system.** Endo, Akira (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1995. 24p. Order Number DE95780483. Source: OSTI; NTIS; INIS.

Calculations were performed to estimate the concentrations of ^{11}C, ^{13}N and ^{15}O induced through the photonuclear reaction in the air of a target room of an electron linear accelerator facility. The angular distributions of bremsstrahlung spectra from a thick-copper target struck with 100 MeV electrons were estimated using a Monte Carlo code EGS4, and a significant air region where the photonuclear reactions of the air nuclei occur was identified. By use of the photon spectrum in this region, the concentrations of ^{11}C, ^{13}N and ^{15}O were calculated and compared with the experimental results. The calculated values agreed with the measured values within a factor 2. (author).

22716 (JINR–94-1, pp. 24-25) **Investigation of spin-neutron angular correlations in processes of capture of polarized muons by light nuclei.** Brudanin, V. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems); Egorov, V.; Kachalkin, A. Joint Inst. for Nuclear Research, Dubna (Russian Federation); Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1994. In *Annual report 1993*. 95p. The objective of this paper was an overview of the breakout session on the physics criteria needed for benchmarking. Contents included a listing of attendees and the physics criteria workgroup session as well as the accident analysis workgroup session.

22761 (LA-SUB–95-3) **[Fission product yields of 60 fissioning reactions]. Final report.** Rider, B.F. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95011620. Source: OSTI; NTIS; INIS; GPO Dep.

In keeping with the statement of work, I have examined the fission product yields of 60 fissioning reactions. In co-authorship with the UTR (University Technical Representative) Talmadge R. England "Evaluation and Compilation of Fission Product Yields 1993," LA-UR-94-3106(ENDF-349) October, (1994) was published. This is an evaluated set of fission product Yields for use in calculation of decay heat curves with improved accuracy has been prepared. These evaluated yields are based on all known experimental data through 1992. Unmeasured fission product yields are calculated from charge distribution, pairing effects, and isomeric state models developed at Los Alamos National Laboratory. The current evaluation has been distributed as the ENDF/B-VI fission product yield data set.

22762 (LA-UR–95-1341) **Multilevel fitting of ^{235}U resonance data sensitive to Bohr-and Brosa-fission channels.** Moore, M.S. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950478–1: International conference on nuclear spectroscopy and nuclear structure, Dubna (Russian Federation), 4-7 Apr 1995). Order Number DE95012066. Source: OSTI; NTIS; INIS; GPO Dep.

The recent determination of the K, J dependence of the neutron induced fission cross section of ^{235}U by the Dubna group has led to a renewed interest in the mechanism of fission from saddle to scission. The K quantum numbers designate the so-called Bohr fission channels, which describe the fission properties at the saddle point. Certain other fission properties, e.g., the fragment mass and kinetic-energy distribution, are related to the properties of the scission point. The neutron energy dependence of the fragment kinetic energies has been measured by Hambsch et al., who analyzed their data according to a channel description of Brosa et al. How these two channel descriptions, the saddle-point Bohr channels and the scission-point Brosa channels, relate to one another is an open question, and is the subject matter of the present paper. We use the correlation coefficient between various data sets, in which variations are reported from resonance to resonance, as a measure of both-the statistical reliability of the data and of the degree to which different scission variables relate to different Bohr channels. We have carried out an adjustment of the ENDF/B-VI multilevel evaluation of the fission cross section of ^{235}U, one that provides a reasonably good fit to the energy dependence of the fission, capture, and total cross sections below 100 eV, and to the Bohr-channel structure deduced from an earlier measurement by Pattenden and Postma. We have also further explored the possibility of describing the data of Hambsch et al. in the Brosa-channel framework with the same set of fission-width vectors, only in a different reference system. While this approach shows promise, it is clear that better data are also needed for the neutron energy variation of the scission-point variables.

22763 (LBL–36651) **The α-induced thick-target γ-ray yield from light elements.** Heaton, R.K. (Queen's Univ., Kingston, ON (Canada). Dept. of Physics). Lawrence Berkeley Lab., CA (United States). Oct 1994. 228p. Sponsored by USDOE, Washington, DC (United States);Natural Sciences and Engineering Research

Council of Canada, Ottawa, ON (Canada). DOE Contract AC03-76SF00098. Order Number DE95011263. Source: OSTI; NTIS; INIS; GPO Dep.

The α-induced thick-target γ-ray yield from light elements has been measured in the energy range 5.6 MeV $\leq E_\alpha \leq$ 10 MeV. The γ-ray yield for > 2.1 MeV from thick targets of beryllium, boron nitride, sodium fluoride, magnesium, aluminum and silicon were measured using the α-particle beam from the Lawrence Berkeley Laboratories 88 in. cyclotron. The elemental yields from this experiment were used to construct the α-induced direct production γ-ray spectrum from materials in the SNO detector, a large volume ultra-low background neutrino detector located in the Creighton mine near Sudbury, Canada. This background source was an order of magnitude lower than predicted by previous calculations. These measurements are in good agreement with theoretical calculations of this spectrum based on a statistical nuclear model of the reaction, with the gross high energy spectrum structure being reproduced to within a factor of two. Detailed comparison of experimental and theoretical excitation population distribution of several residual nuclei indicate the same level of agreement within experimental uncertainties.

22764 (LBL–36883) **First results from NA49 on Pb+Pb collisions at 158 GeV/nucleon.** Margetis, S. NA49 Collaboration. Lawrence Berkeley Lab., CA (United States). Mar 1995. 13p. Sponsored by USDOE, Washington, DC (United States);Polish State Committee for Scientific Research (Poland);Bundesministerium fuer Forschung und Technologie, Bonn (Germany);Polish-German Foundation;Athens Univ. (Greece). DOE Contract AC03-76SF00098. (CONF-950127–11: 11. international conference on ultra-relativistic nucleus-nucleus collisions, Monterey, CA (United States), 9-13 Jan 1995). Order Number DE95012326. Source: OSTI; NTIS; INIS; GPO Dep.

First results from the NA49 experiment with a ^{208}Pb beam on a Pb target at the CERN SPS with total energy of 33 TeV are presented. Data on transverse energy production, forward energy flow and rapidity density of negative hadrons are shown and discussed. The degree of nuclear stopping and the energy densities achieved are estimated for near head-on collisions.

22765 (LBL–37020) **Strange particle measurements from the EOS TPC.** Justice, M. Lawrence Berkeley Lab., CA (United States). Feb 1995. 8p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098 ; FG02-89ER40531 ; FG02-88ER40408 ; FG02-88ER40412 ; FG05-88ER40437. PHY9123301. (CONF-950191–1: 23. international winter meeting on nuclear physics, Bormio (Italy), 23-28 Jan 1995). Order Number DE95012327. Source: OSTI; NTIS; INIS; GPO Dep.

EOS Collaboration.

A high statistics sample of Λ's produced in 2 GeV/nucleon ^{58}Ni + ^{nat}Cu collisions has been obtained with the EOS Time Projection Chamber at the Bevalac. The coverage of the EOS TPC is essentially 100% for $y > y_{cm}$ and extends down to $P_T = 0$ where interesting effects such as collective radial expansion may be important. In addition, the detection of a majority of the charged particles in the TPC, along with the presence of directed flow for protons and heavier fragments at this beam energy, allows for the correlation of A production with respect to the event reaction plane. Our preliminary analysis indicates the first observation of a sidewards flow signature for A's. Comparisons with the cascade code ARC are made.

22766 (UCRL-ID–119181) **High energy heavy ion experiments.** Thomas, J.; Jacobs, P. Lawrence Livermore National Lab., CA (United States). Nov 1994. 97p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950127–6: 11. international conference on ultra-relativistic nucleus-nucleus collisions, Monterey, CA (United States), 9-13 Jan 1995). Order Number DE95012258. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains a list of the major heavy ion experiments conducted at CERN and Brookhaven.

22767 (UCRL-ID–119854) **Heavy ion physics at the Brookhaven alternating gradient synchrotron.** Sangster, T.C. Lawrence Livermore National Lab., CA (United States). 30 Jan 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011696. Source: OSTI; NTIS; INIS; GPO Dep.

The collision of large nuclei at relativisitic energies is the only known mechanism for creating and studying the properties (equation-of-state, EOS) of extremely dense nuclear matter. At sufficiently high matter densities, one of the most exciting possibilities is the formation of a Quark Gluon Plasma (QGP). However, it is an extremely difficult task to determine the ultimate density achieved during these collisions due to the fleeting nature of the high density state (the lifetime of these states is typically a few times 10-24 ns). We must rely on detailed comparisons between experimental measurements and complex Monte Carlo simulations of the colliding nuclei in order to extract meaningful estimates of the nuclear matter EOS. Our approach has been to study the behavior of the spectator matter (those protons and neutrons which do not directly interact during the collision) to determine the dynamics of the high density state which must necessarily influence the spectator matter as it decays. This report summarizes some of the key results of our study.

22768 (UCRL-JC–118789) **Experimental status of the AGS Relativistic Heavy Ion Program.** Sangster, T.C. Lawrence Livermore National Lab., CA (United States). Oct 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940722–46: 27. international conference on high energy physics, Glasgow (United Kingdom), 21-27 Jul 1994). Order Number DE95011763. Source: OSTI; NTIS; INIS; GPO Dep.

The universal motivation for colliding large nuclei at relativistic energies is the expectation that a small volume of the primordial quark soup, generally referred to as the Quark-Gluon Plasma (QGP), can be created and studied. The QGP is formed via a phase transition caused by either the extreme baryon densities and/or the extreme temperatures achieved in the overlap zone of the two colliding nuclei. Experiments at the Brookhaven National Laboratory Alternating Gradient Synchrotron (AGS) using a beam of Si nuclei at 14.6 GeV per nucleon on various nuclear targets have been completed. These same experiments are now actively searching for signatures of QGP formation using a beam of Au nuclei at 11.7 GeV per nucleon. This paper briefly summarizes some of the key results from the Si beam program and the current status of the experimental Au beam program at the AGS.

22769 (UCRL-JC–119948) **Impact of atmospheric turbulence on Van Cittert-Zernike speckle cell area estimates.** Morris, J.R. Lawrence Livermore National Lab., CA (United States). 17 Mar 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9503149–1: 2. chemical analysis by laser interrogation of proliferation effluents (CALIOPE) meeting, Albuquerque, NM (United States), 28-30 Mar 1995). Order Number DE95011750. Source: OSTI; NTIS; INIS; GPO Dep.

Simulations of laser beam propagation at 3.5 microns wavelength through atmospheric turbulence are used to characterize on-target irradiance profiles and the Van Cittert-Zernike speckle cell areas associated therewith. Results for a 3 km horizontal path with C_N^2 values between 2.5×10^{-14} and 5×10^{-13} $m^{-2/3}$ are compared with those for a 20 km near-vertical slant path for a C_N^2 versus altitude with a near-ground value of $5 \times 10^{--13} m^{-2/3}$ and a Huffnagel-Valley type shape. The irradiance fluctuations for the slant path are much smaller than for the shorter horizontal path.

The speckle cell area for the slant path is approximately the vacuum-path value; for the 3 km horizontal path it is at most 3 times the vacuum-path value.

22770 (WHC-SD-MP-SWD-30001-Rev.7) **Certification of MCNP Version 4A for WHC computer platforms. Revision 7.** Carter, L.L. Westinghouse Hanford Co., Richland, WA (United States). 3 May 1995. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011546. Source: OSTI; NTIS; INIS; GPO Dep.

MCNP is a general-purpose Monte Carlo code that can be used for neutron, photon, or coupled neutron/photon transport, including the capability to calculate eigenvalues for critical systems. The code treats an arbitrary three-dimensional configuration of materials in geometric cells bounded by first- and second-degree surfaces, and some special fourth-degree surfaces (elliptical tori).

6640 Atomic and Molecular Physics

22771 (LBL–36919) **New results in atomic physics at the Advanced Light Source.** Schlachter, A.S. Lawrence Berkeley Lab., CA (United States). Jan 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-941268–2: 4. U.S./Mexico joint symposium on atomic and molecular physics, San Juan Del Rio (Mexico), 7-10 Dec 1994). Order Number DE95012329. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Light Source is the world's first low-energy third-generation synchrotron radiation source. It has been running reliably and exceeding design specifications since it began operation in October 1993. It is available to a wide community of researchers in many scientific fields, including atomic and molecular science and chemistry. Here, new results in atomic physics at the Advanced Light Source demonstrate the opportunities available in atomic and molecular physics at this synchrotron light source. The unprecedented brightness allows experiments with high flux, high spectral resolution, and nearly 100% linear polarization.

6642 Spectra of Atoms and Molecules and Their Interactions With Photons

22772 (LBL–36923) **X-ray Raman scattering in H-BN observed by soft x-ray fluorescence spectroscopy.** Jia, J.J. (Tennessee Univ., Knoxville, TN (United States)); Callcott, T.A.; Carlisle, J.A.; Terminello, L.J.; Asfaw, A.; Ederer, D.L.; Himpsel, F.J.; Perera, R.C.C. Lawrence Berkeley Lab., CA (United States). Mar 1995. 15p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Grants DMR-9017996, DMR-9017997. Order Number DE95012360. Source: OSTI; NTIS; GPO Dep.

Raman scattering of soft x-rays is observed in h-BN using monochromatic soft x-rays just below the B K absorption edge. The inelastic features are visible below threshold, track with the excitation energy, go through a resonance as the excitation is tuned to the B ls core exciton energy, and finally evolve into normal fluorescence as the excitation is raised above the energy needed to excite the B ls electron into the conduction band. The inelastic energy loss is identified as an excitation of valence σ electrons into the π^* valence exciton state; at resonance and above, $\pi - \pi^*$ transitions are also observed. At resonance, a sideband on the elastic peak Ls observed, which gives evidence of additional electronic and phonon loss processes. Very similar results have also been observed for B_2O_3.

22773 (UCRL-JC–117697) **Spectral measurements of few-electron uranium ions produced and trapped in a high-energy electron beam ion trap.** Beiersdorfer, P. Lawrence Livermore National Lab., CA (United States). 4 Nov 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941129–26: 13. international conference on the application of accelerators in research and industry, Denton, TX (United States), 7-10 Nov 1994). Order Number DE95014125. Source: OSTI; NTIS; INIS; GPO Dep.

Measurements of $2s_{1/2}$-$2p_{3/2}$ electric dipole and $2p_{1/2}$-$2p_{3/2}$ magnetic dipole and electric quadrupole transitions in U^{82+} through U^{89+} have been made with a high-resolution crystal spectrometer that recorded the line radiation from stationary ions produced and trapped in a high-energy electron beam ion trap. From the measurements we infer -39.21 ± 0.23 eV for the QED contribution to the $2s_{1/2}$-$2p_{3/2}$ transition energy of lithiumlike U^{89+}. A comparison between our measurements and various computations illustrates the need for continued improvements in theoretical approaches for calculating the atomic structure of ions with two or more electrons in the L shell.

22774 (BNL–61720) **Inelastic cross sections for positron scattering from atomic hydrogen.** Weber, M. (Bielefeld Univ. (Germany). Fakultaet fuer Physik); Hofmann, A.; Raith, W.; Sperber, W.; Jacobsen, F.; Lynn, K.G. Brookhaven National Lab., Upton, NY (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9405170–10: 10. international conference on positron annihilation, Beijing (China), 23-29 May 1994). Order Number DE95013845. Source: OSTI; NTIS; INIS; GPO Dep.

Positronium formation (Ps) cross sections for positrons impinging on atomic hydrogen were measured in the impact energy range from 13eV to 255eV at the High Intensity Positron (HIP) beam at Brookhaven National Laboratory (BNL). The Ps-formation cross section was found to rise rapidly from the threshold at 6.8eV to a maximum value of $(2.98 \pm 0.18) \times 10^{-16}$ cm^2 for $\approx$ 15eV positrons. By 75eV it drops below the detection limit of 0.17×10^{-16} cm^2 which is the present level of statistical uncertainty. The experiment was modified to enable the measurement of doubly differential scattering cross sections.

22775 (UCRL-JC–112929) **Measurements of cross sections and resonance structures following electron-impact excitation/ionization of Na-like Kr and Xe.** Schneider, D.; Dewitt, D.; Knapp, D.A.; Reed, K.J.; Chen, M.H. Lawrence Livermore National Lab., CA (United States). 28 Sep 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941129–25: 13. international conference on the application of accelerators in research and industry, Denton, TX (United States), 7-10 Nov 1994). Order Number DE95011731. Source: OSTI; NTIS; GPO Dep.

We report high-resolution measurements of electron impact excitation and ionization cross sections for the Na-like ions Kr^{25+} and Xe^{43+}. Ions with ionization states centered on the Na-like configurations were produced in an electron beam ion trap (EBIT) using electrons with energies below the L shell ionization thresholds. The Na-like ions were exposed to an electron beam with an energy between 3 and 7 keV. The Na- and Ne-like ions were then extracted and their intensities measured as a function of the electron beam energy. Theoretical ionization cross sections were calculated using relativistic distorted wave methods. Complex resonance structures that appear in the computed cross sections are observed in the experimental results. These results are the first experimental observation of resonant-excitation-double-autoionization (READA) in highly charged high-Z ions.

22776 (LBL–36615) **Transition undulator radiation as bright infrared sources.** Kim, Kwang-Je. Lawrence Berkeley Lab., CA (United States). Dec 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950261–3: Contribution for Halbach Festschrift, Berkeley, CA (United States), 3 Feb 1995). Order Number DE95011276. Source: OSTI; NTIS; INIS; GPO Dep.

Undulator radiation contains, in addition to the usual component with narrow spectral features, a broad-band component in the low frequency region emitted in the near forward direction, peaked at

an angle $1/\gamma$, where γ is the relativistic factor. This component is referred to as the transition undulator radiation, as it is caused by the sudden change in the electron's longitudinal velocity as it enters and leaves the undulator. The characteristics of the transition undulator radiation are analyzed and compared with the infrared radiation from the usual undulator harmonics and from bending magnets.

22777 (IC–95/78) **Nonlocal stabilized jellium clusters.** Nafari, N. (International Centre for Theoretical Physics, Trieste (Italy)); Payami, M. International Centre for Theoretical Physics, Trieste (Italy). May 1995. 29p. Order Number DE95634209. Source: OSTI; NTIS (US Sales Only); INIS.

We have used the stabilized spherical jellium model for the simple metal clusters ($2 \leq N \leq 1106$), i.e., Li, Na are K and have solved the Kohn-Sham equations self-consistently. The comparison of the local and nonlocal density approximations shows an appreciable difference between the total cluster-energies per atom for small size clusters. The magnitudes of these local-nonlocal energy differences in the case of the simple spherical jellium model are greater than the deformation energy differences brought about by the application of the ellipsoidal jellium model. The calculated binding energies for the stabilized spherical jellium model, in the limit of large cluster sizes, are close to the value of the bulk experimental binding energy of the corresponding metal. This is to be contrasted with the simple jellium model binding energy which is nearly three times smaller. The ionization potentials remain more or less the same for the local and nonlocal approximations and approach the bulk metal work functions. (author). 37 refs, 7 figs.

22778 (INS–1080) **Phase and density dependence of the delayed annihilation of metastable antiprotonic helium atoms in gas, liquid and solid helium.** Widmann, E. (and others); Sugai, I.; Yamazaki, T. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Dec 1994. 25p. Order Number DE95780501. Source: OSTI; NTIS; INIS.

Systematic studies of the phase and density dependence of the delayed annihilation time spectra of antiprotons (DATS) in gaseous, liquid and solid helium have been performed using the Low Energy Antiproton Ring (LEAR) at CERN. The results show a small but significant dependence of DATS on the phase and density of the helium medium. The average lifetime of antiprotons (T_{av}) in gas at 10-30 K was found to be 4.03 ± 0.02 μs. In liquid helium T_{av} decreases with density from 3.0 μs at 1 bar to 2.5 μs at 60 bar, while in solid helium its value is 2.14 ± 0.03 μs, 20% shorter than that in liquid helium of the same density. There is no change of DATS between normal 1-bar liquid and superfluid helium. An isotope effect between ^{4}He and ^{3}He similar to the one previously observed in the gas phase has also been found for liquid helium. All the data can be fitted fairly well with a simple three-level chain decay model which describes the general structure of DATS, characterized by downward curving behavior on a logarithmic scale at later times and by the presence of a short-lived component. No delayed annihilation was observed in lithium. (author).

Cornell Univ., Ithaca, NY (United States). Mar 1995. 279p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER45278. Order Number DE95011595. Source: OSTI; NTIS; GPO Dep.

This report discusses the following topics: strained layer defects; the structural and electronic characteristics of misfit dislocations; requirements for the growth of high quality, low defect density InGaAs strained epitaxial layers; the isolation and nucleation of misfit dislocations in strained epitaxial layers grown on patterned, ion-damaged GaAs; the effect of pattern substrate trench depth on misfit dislocation density; the thermal stability of lattice mismatched InGaAs grown on patterned GaAs; misfit dislocations in ZnSe strained epitaxial layers grown on patterned GaAs; and the measurement of deep level states caused by misfit dislocations in InGaAs/GaAs grown on patterned GaAs substrates.

22784 (IC–95/73) **Asymptotic solution of the non-isothermal Cahn-Hilliard system.** Omel'yanov, G.A. International Centre for Theoretical Physics, Trieste (Italy). May 1995. 27p. Grant 93-011-16560. Order Number DE95634466. Source: OSTI; NTIS (US Sales Only); INIS.

The non-isothermal Cahn-Hillard questions with a small parameter in the n-dimensional case ($n = 2.3$) are considered. The small parameter is proportional both to the relaxation time and to the linear scale of transition zone, so the large time process is examined. The asymptotic solution describing the free interface dynamics is constructed. As the small parameter tends to zero, the limiting solution satisfies the modified Stefan problem with corrected Gibbs-Thomson law. The justification of the asymptotic solution is proved. (author). 26 refs.

This thesis contains three parts. In the first part, before getting into the discussion of magneto-optical properties for the systems

under study, the author reviews some background subjects, such as the energy-band theory within the framework of density functional theory, the multiple scattering approach to the solution of band problem and its relation with the LMTO method, an account of the tight-binding LMTO method which we use exclusively in our calculations, the linear response theory and its application to the quantum theory of dielectric constants. In second part, circular magnetic x-ray dichroism, as a powerful and newly experimental technique for quantitative study of the magnetic properties of materials, is discussed. In the last part, the detailed study of the magneto-optical properties of some transition metals and the so-called half metallic Heusler alloys is presented.

22786 (IS-T–1732) **Measurement and modelling of structure sensitive magnetic properties of material.** Chen, Zhao-Jun. Ames Lab., IA (United States). 10 Feb 1995. 202p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. Order Number DE95010128. Source: OSTI; NTIS; GPO Dep.

Due to the fact that magnetic properties of ferromagnetic materials are highly microstructure sensitive, magnetic non-destructive testing (NDT) techniques for material evaluation have developed very quickly in recent years. This dissertation is mainly focused on the magnetic hysteresis measurement technique. The modelling of structure-sensitive magnetic properties will be discussed first. As a result, the relationship between defect density, the initial permeability and the hysteresis parameter k will be developed. This is followed by the application of magnetic hysteresis measurement techniques in the detection of fatigue damage and creep damage. It will be shown that structure sensitive magnetic properties such as coercivity, remanence, hysteresis loss and initial permeability are very sensitive to material degradation due to fatigue and creep effects. Finally, practical problems in hysteresis measurement will be discussed and techniques to overcome these difficulties will also be presented.

22787 (SAND–95-0775) **Unified model of the rf plasma sheath.** Riley, M.E. Sandia National Labs., Albuquerque, NM (United States). May 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95012114. Source: OSTI; NTIS; GPO Dep.

By developing an approximation to the first integral of the Poisson equation, one can obtain solutions for the voltage-current characteristics of a radio-frequency (rf) plasma sheath that are valid over the whole range of inertial response of the ions to an imposed rf voltage or current-specified conditions. The theory adequately reproduces the time-dependent voltage-current characteristics of the two extreme cases corresponding to the Lieberman rf sheath theory and the Metze-Ernie-Oskam theory. Contained within the approximation is a time constant which controls the amount of ion response to the rf electric field. A prescription is given for determining this ion relaxation time constant, which also determines the time-dependent ion impact energy on the electrode surface.

(CONF-941144–162-Rev.1: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95013274. Source: OSTI; NTIS; INIS; GPO Dep.

Using a recently developed spin-polarized, fully relativistic, multiple scattering approach based on the layer KKR Green function method, we have reproduced the Fe 3p angle-resolved soft x-ray photoemission spectra and analyzed the associated large magnetic dichroism effects for excitation with both linearly and circularly polarized light. Comparison between theory and experiment yields a spin-orbit splitting of 1.0–1.2 eV and an exchange splitting of 0.9–1.0 eV for Fe 3p. These values are 50–100% larger than those hitherto obtained experimentally.

Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95012463. Source: OSTI; NTIS; INIS; GPO Dep.

This essay presents remarks on the meaning of stopping, power and of its magnitude. More precisely, the first set of remarks concerns the connection of stopping power with elements of particle-transport theory, which describes particle transport and its consequences in full detail, including its stochastic aspects. The second set of remarks concerns the magnitude of the stopping

power of a material and its relation with the material's electronic structure and other properties.

22794 (CONF-9407184–1) **Laser induced diffusion of ion-implanted bismuth in fused silica.** Park, S.Y. (Vanderbilt Univ., Nashville, TN (United States). Materials Science and Engineering); Weeks, R.A.; Zuhr, R.A. Oak Ridge National Lab., TN (United States). [1994]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 5. international Otto Schott colloquium; Jena (Germany); 11-14 Jul 1994. Order Number DE95012869. Source: OSTI; NTIS; GPO Dep.

The near surface regions of optical grade fused silica discs (Spectrosil A) were modified by implantation with bismuth ions at 160 and 320 keV and at room temperature. The glasses implanted with a nominal dose of 6×10^{16} Bi^{2+} ions/cm^2 were subsequently annealed with a 5 eV KrF pulsed excimer laser and by a furnace in oxygen atmosphere. Rutherford backscattering and optical absorption were measured before and after the anneals. Backscattering profiles after laser anneal showed shifts of the profiles toward the surface with decrease in retained dose. We attribute the diffusion of bismuth to Soret effect. Profiles of furnace annealed samples showed that the diffusion was both toward and away from the surface.

Studies of the charging effects during implantation with 9200 and 9500 tools using EEPROM-based sensors, CHARM-2, are reported for 60keV As beams.

6654 Quantum Physics Aspects of Condensed Matter

22800 (IC–95/53) **Integrable Chern-Simons gauge field theory in 2 + 1 dimensions.** Pashaev, O.K. International Centre for Theoretical Physics, Trieste (Italy). Apr 1995. 16p. Order Number DE95634579. Source: OSTI; NTIS (US Sales Only); INIS.

The classical spin model in planar condensed media is represented as the U(1) Chern-Simons gauge field theory. When the vorticity of the continuous flow of the media coincides with the statistical magnetic field, which is necessary for the model's integrability, the theory admits zero curvature connection. This allows me to formulate the model in terms of gauge -invariant fields whose evolution is described by the Davey-Stewartson (DS) equations. The Self-dual Chern-Simons solitons described by the Liouville equation are subjected to corresponding integrable dynamics. As a by-product the 2 + 1-dimensional zero-curvature representation for the DS equation is obtained as well as the new reduction conditions related to the DS-I case. Some possible applications for the statistical transmutation in the anyon superfluid and TQFT are briefly discussed. (author). 21 refs.

22801 (IC–95/75) **Global Bethe lattice consideration of the spin-1 Ising model.** Akheyan, A.Z.; Ananikian, N.S. International Centre for Theoretical Physics, Trieste (Italy). May 1995. 24p. Grant 211-5291YPI; INTAS-93-633. Order Number DE95634580. Source: OSTI; NTIS (US Sales Only); INIS.

The spin-1 Ising model on the Bethe lattice with bilinear, biquadratic exchange interactions and a single-ion crystal field by means of recursion relations is solved exactly. A full set of phase diagrams for positive and negative biquadratic couplings are constructed. A general procedure for the investigation of the critical properties is discussed. A comparison with other approximation schemes is done. (author). 24 refs, 4 figs.

22802 (IC–95/92) **Quantum critical phenomena and conformal invariance.** Zhe Chang. International Centre for Theoretical Physics, Trieste (Italy). May 1995. 18p. Order Number DE95634581. Source: OSTI; NTIS (US Sales Only); INIS.

We show that the Abelian bosonization of continuum limit of the 1D Hubbard model corresponds to the 2D explicitly conformal invariant Gaussian model at weak coupling limit. A universality argument is used to extend the equivalence to an entire segment of the critical line of the strongly correlated electron system. An integral equation satisfied by the mapping function between critical lines of the 1D Hubbard model and 2D Gaussian model is obtained and then solved in some limiting cases. By making use of the fact that the free Hubbard system reduces to four fermions and each of them is related to a c = 1/2 conformal field theory, we present exactly the partition function of the Hubbard model on a finite 1D lattice. Since the discovery of the anomalous normal state properties of the high-T_c oxides, there has been a lively debate concerning the applicability of conventional Fermi liquid theory to strongly interacting metals. A question arising naturally in this context is whether strongly interacting insulators exhibit properties at odds with ordinary band theory. Of course, Mott insulators, which in the absence of strong Coulomb interactions would be metals, represent the most dramatic breakdown of band theory. However, among strongly interacting insulators which one believes are band insulators, there have until recently been no indications that many-body effects yield observable consequences beyond those which band parameter renormalization might account for. The large number of recent theoretical papers on this renormalization for f-band materials, as well as the long struggle to achieve quantitative understanding of the band gap in as basic a semiconductor as Si, attest to the importance and difficulty of calculating renormalized band parameters for insulators. Also, the experience with Si clearly shows that the renormalization can depend on the quantity being measured. In a recent review, the authors placed the newly discovered Ce-based Kondo insulators, as well as older anomalous semiconductors such as SmB_6 and FeSi, in the context of renormalized band theory. The conclusion was that in large measure, this theory represents an adequate starting point for understanding strongly correlated insulators. The goal here is not to repeat what was said before, but to focus on those aspects of charge and spin fluctuations which the band picture cannot obviously accomodate.

22804 (LA-UR–94-1148, pp. 36-40) **Magnetotransport measurements in magnetic fields up to 50T in SmB_6 and FeSi.** Lacerda, A. (Los Alamos National Laboratory, NM (United States)); Graf, T.; Sarrao, J.L.; Mandrus, D.; Hundley, M.F.; Thompson, J.D.; Fisk, Z.; Van Bockstal, L. Los Alamos National Lab., NM (United States). [1994]. Agreement DMR-9016241. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

The authors have measured the transverse magnetoresistance ($B \perp I$) in high-quality single-crystalline samples of SmB_6 and FeSi at 4K in applied magnetic fields to 50T and in the temperature range $4K < T < 150K$ in magnetic fields to 18T. The magnetoresistance in SmB_6 at 4K decreases quadratically and reaches about −45% at 50T. The compound FeSi reveals three distinct features in the magnetoresistance: (a) a negative magnetoresistance for fields below 5T, (ii) a kink at around 10T, and (iii) a broad maximum near 30T.

22805 (LA-UR–94-1148, pp. 41-45) **Magnetic excitations in Kondo insulators.** Wang, Z. (Los Alamos National Laboratory, NM (United States)); Lee, D.H. Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

The authors perform analytical and numerical analysis for the spin dynamics in Kondo insulators. Recently a class of heavy-fermion insulator (known as the 'Kondo insulator') found among stoichiometric rare earth actinide compounds has attracted much experimental and theoretical interest. In many respects, these insulating materials are similar to the more weakly-correlated band-insulators, except that the insulating gap is orders of magnitude smaller than that in conventional band-insulators. In a recent paper the present authors described a class of variational wavefunctions in which the Kondo insulators are viewed as the band-insulating state of the heavy quasiparticles.

22806 (LA-UR–94-1148, pp. 46-49) **On the temperature dependence of the optical spectral weight in correlated electron systems.** Millis, A.J. (AT&T Bell Laboratories, Murray Hill, NJ (United States)). Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

A temperature dependence of the low frequency optical spectral weight has recently been observed in several strongly correlated insulating or nearly insulating systems including FeSi, $Ce_3Bi_4Pt_3$ and V_2O_{3-y}, and Bi_2Te_3. This temperature dependence is at first sight surprising because one is accustomed to thinking of optical spectral weigth in terms of the f-sum rule, which in its most general form states that the integral of any of the diagonal components of the optical conductivity $\sigma_1(\omega)$ is $\pi ne^2/2m$. This is not very useful in most condensed matter physics contexts because the quantity n is the total number of electrons, including e.g. those in core levels, and because one must extend the integral to energies greater than the binding energy of the 1s shell to exhaust the sum rule. In condensed matter problems one typically focuses on a small number of bands close to the chemical potential. One may then ask what is the restricted sum rule governing optical transitions involving only these bands. Of course, the answer to this question is useful only if optical transitions involving bands retained in the model can be separated from those involving bands not retained.

22807 (LA-UR–94-1148, pp. 50-53) **Fermi surface instability at 0.4K in a heavy-fermion YbBiPt: SDW?.** Movshovich, R. (Los Alamos National Laboratory, NM (United States)); Lacerda, A.; Canfield, P.C.; Thompson, J.D.; Fisk, Z. Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

The authors report results of resistivity measurements of heavy-fermion compound YbBiPt at ambient and hydrostatic pressures of up to ≈6kbars and in magnetic fields up to 1 Tesla. They interpret the rise of resistivity below 0.4K as partial gapping of the Fermi surface. From the temperature dependence of the resistivity they obtain the value of the weak coupling energy gap of $\Delta_0/k_BT_c = 1.65 \pm 0.15$. Magnetic field - transition temperature phase diagram follows the weak coupling BCS expression remarkably well from T_c to $T_c/4$. These results support identification of 0.4K transition as a Spin Density Wave formation.

22808 (LA-UR–94-1148, pp. 96-100) **Influence of magnetic order on optical properties of the heavy-electron antiferromagnets.** Degiorgi, L. (Laboratorium fuer Festkoerperphysik, Zuerich (Switzerland)); Ott, H.R.; Gruener, G.; Dressel, M.; Fisk, Z. Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

The authors discuss the influence of antiferromagnetic order on optical properties of several heavy-electron systems. They find different electrodynamic responses of local magnetic moment and itinerant heavy-electron antiferromagnets. The electrodynamics of several heavy-electron metals have been explored in detail. However, significantly less is known about the electrodynamics of the magnetically-ordered states of these materials. Some prototype compounds, where antiferromagnetic order develops, are URu_2Si_2, UPd_2Al_3, U_2Zn_{17}, and UCu_5. The so called antiferromagnetic state can develop as the consequence of a Fermi-surface instability, and such spin density wave formation leads to a gap (or partial gap) $2\Delta = 3.52k_BT_N$ at the Fermi level. A commensurate antiferromagnetic order, on the other hand, does not lead to a gap at the Fermi level for a partially filled band. The first case is called an itinerant, and the second a local moment antiferromagnet. While magnetic properties such as the magnetic susceptibility may be similar in both cases, optical conductivity measurements may discriminate between the different types of antiferromagnetic order.

22809 (LA-UR–94-1148, pp. 101-105) **4f heavy femion photoelectron spectra do not exhibit the Kondo scale.** Arko, A.J. (Los Alamos National Laboratory, NM (United States)); Joyce, J.J.; Andrews, A.B.; Blyth, I.R.; Barlett, R.J.; Fisk, Z.; Canfield, P.C.; Olson, C.G.; Benning, P.J.; Poirier, D.M.; Weaver, J.H.; Riseborough, P.S. Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM

(United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

It has been the authors contention for some time that the Single Impurity Anderson Model (SIAM), as extended by Gunnarsson and Schonhammer (GS), or the non-crossing approximation (NCA), does not correctly describe the 4f photoelectron spectra of heavy fermions. Recently they have concentrated on Yb heavy fermions since in these materials the Kondo resonance (KR) is fully occupied and thus accessible via photoemission. In particular, they have repeatedly pointed out that the width, position, spectral weight, lineshape, and temperature dependence of the features assumed to be the KR and its sidebands, are nearly independent of the Kondo temperature, T_K, while at the same time bearing a striking resemblance to the simple 4f core level spectra of pure Yb metal, or of Lu isostructural Lu compounds. It is important to resolve these issues in view of the fundamental nature of the problem.

22810 (LA-UR–94-1148, pp. 131-170) **The mean field theory of the Mott Hubbard transition.** Kotliar, G. (Rutgers Univ., Piscataway, NJ (United States)). Los Alamos National Lab., NM (United States). [1994]. Grant DMR 92-42000. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

The author describes the mean field theory of strongly correlated electrons which becomes exact in the limit of large lattice coordination and applies it to the Mott transition in the Hubbard model. He compares the predictions of the mean field theory with earlier approaches and with experiments on three dimensional transition metal oxides, and outlines possible extensions of the approach.

22811 (LA-UR–94-1148, pp. 177-222) **The metal-insulator transition in one dimension.** Schultz, H.J. (Universite Paris, Orsay (France)). Los Alamos National Lab., NM (United States). [1994]. Contract CII/0568. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

The low-energy excited states of a system of interacting one-dimensional fermions in a conducting state are collective charge and spin density oscillations. The unusual physical properties of such a system (called 'Luttinger liquid') are characterized by the velocities u_ρ and u_σ of the charge and spin excitations, as well as by a parameter K_ρ that determines the power law behavior of correlation functions. Umklapp scattering occurring at half-filling or other commensurate band-filling can lead to a transition into an insulating state, characterized in particular by a gap in the charge excitations (the Mott-Hubbard gap). The properties in the vicinity of the transition are shown to depend on both the way the transition is approached (constant bandfilling and varying interaction, or constant interaction and varying bandfilling) and on the 'order' of the commensurability. In particular, even and odd fractional fillings show quite different behavior. This behavior is illustrated in detail using lattice models like the Hubbard model and its extensions.

22812 (LA-UR–94-1148, pp. 224-228) **Metal insulator transition in strongly correlated electron systems.** Gulacsi, M. (Los Alamos National Laboratory, NM (United States)); Bedell, K.S. Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

For the one-dimensional Hubbard model the authors extended the bosonization technique, away from half filling, in such a way that a general formula is obtained for the zero temperature equal-time single-particle Green function with validity over the whole doping range. With their method they can describe exactly the metal-insulator transition at half filling.

22813 (LA-UR–94-1148, pp. 229-233) **Bosonization in two dimensions - application to strongly correlated electrons.** Schmeltzer, D. (City Univ. of New York, NY (United States)); Bishop, A. Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

Using the space time curve representation, a Bosonization scheme which includes density excitations around each point on the Fermi surface (F.S.) and space time tunneling of charges which belong to different F.S. Points. The space time tunneling reproduces the two dimensional Jordan-Wigner transformation in two dimensions. Using this formalism a spinless fermion model with short range repulsion interaction is investigated. The authors find two parts: sound wave excitations in the normal direction of the F.S. reproduces the Fermi Liquid (F.L.). The second part corresponds to the Cooperon channel, violates charge conservation and gives rise to two particle coherent tunneling. As a results the F.L. phase is destroyed at $T = 0$ and a tunneling gap for charge 2e is formed. They apply their formalism to the t-J model and find that due to the presence of the holon condensate a F.L. phase is obtained. If at $T \neq 0$ the holon condensate disappears, due to thermal vortices a singular propagator for the U(1) gauge field appears giving rise to a non-Fermi liquid (N.F.L.) behavior. The N.F.L. can be understood as a quantum critical behavior with a dynamic exponent $z = 3$.

An overview of the phase diagram of the frustrated Quantum Antiferromagnet in two dimensions is given. Special emphasis is made on the nature of the ground states and phases transitions occurring to the classical boundary between the Neel and Spiral states. Most of the work performed on 2+1 dimensional magnetism has focused on the possible ways to destabilize the Neel phase and the nature of the resulting ground state and excitations. This can be achieved by introducing either static or dynamic frustration. This paper will give an overview of the phase diagram of the Quantum Antiferromagnet on a square lattice, where static antiferromagnetic frustration is added to second and third nearest neighbours (given by the coupling constants J_2 and J_3 respectively). Initial studies of this model using a variety of techniques gave rise to different and contradictory results for its ground state close to the classical phase boundary of the Neel phase. This boundary will be termed hereafter as the Classical Critical Line and is given by the equation $J_1 - 2$, $J_2 - 4$, $J_3 = 0$. Some time later, it was found that most of these techniques would give essentially the same results, when used with some care. The phase diagram which emerged finally did not coincide with any of the initial ones, but had features from all of them.

22815 (LA-UR–94-1148, pp. 241-268) **Experimental results on the nature of the superconducting-insulating transition in two dimensions.** Hebard, A.F. (AT&T Bell Laboratories, Murray Hill, NJ (United States)). Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

Experiments probing the competition between superconductivity and disorder in two-dimensional thin-film systems, although not completely understood, have given fascinating glimpses of subtle and unexpected quantum processes and associated phase transitions. There is a general consensus that a superconducting-insulating transition does occur, although there is some disagreement on details. Much of this disagreement arises from the wide disparity in the physical characteristics of the thin-film systems that have been studied and the number of ways in which parameters can be varied to experimentally traverse the boundary between the superconducting and insulating phases. In this paper,

salient experimental results pertaining to the superconducting-insulating transition will be summarized and placed into context with respect to available theoretical prescriptions. Close attention will be paid to the evidence for a boson-dominated transition in which fluctuations in the phase rather than the magnitude of the superconducting order parameter dominate.

22816 (LA-UR–94-1148, pp. 275-304) **The superconducting-insulating phase transition in disordered systems.** Zimanyl, G.T. (Univ. of California, Davis, CA (United States)). Los Alamos National Lab., NM (United States). [1994]. Grant DRM 92-06032. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

The superconductor-insulator transition is considered in the framework of a bosonic description. The scaling theory of the transition is outlined. Several particular cases are discussed: the ordered situation with short and long range interactions; Josephson junction arrays; the same systems in the presence of disorder; and the transition in a magnetic field.

Strongly interacting quantum systems exhibit some of the most interesting phenomena in condensed matter physics. Until very recently the study of these systems has been confined to either numerical simulations of rather small systems (which still have an enormous number of quantum states) or approximate analytical methods which are uncontrolled. Most of the effort concentrated on the fermionic systems. In the last few years the bosonic systems have attracted a lot of interest. Examples of the bosonic strongly correlated systems include short coherence length superconductors, Josephson junction arrays, the dynamics of flux lines in high temperature superconductors and the quantum hall effect. The essential physics of all of these problems is the competition between the hopping matrix elements and the short range strong repulsion.

The authors consider a solvable model of a one dimensional electron gas interacting with an array of dynamical scattering centers, whose state is specified by a pseudospin variable. In the dilute limit, for frequencies ω and temperatures T below the single-center Kondo scale but above a coherence scale Δ, the physics is governed by the fixed point of the single-impurity two-channel Kondo problem. In that region, the physical properties are governed by composite (or odd-frequency) pairing fluctuations and they are reminiscent of the normal state of high temperature superconductors. As ω and $T \rightarrow 0$, three susceptibilities are equally divergent: (1) conventional, spin-singlet even-parity pairing (2) composite spin-singlet odd-parity η-pairing and (3) odd parity pseudospin.

The development of high-temperature superconductors (HTSs) can be broadly generalized into thin-film electronics, wire applications, and bulk applications. We consider bulk HTSs to include sintered or crystallized forms that do not take the geometry of filaments or tapes, and we discuss major applications for these materials. For the most part applications may be realized with the HTSs cooled to 77 K, and the properties of the bulk HTSs are often already sufficient for commercial use. A non-exhaustive list of applications for bulk HTSs includes trapped field magnets, hysteresis motors, magnetic shielding, current leads, and magnetic bearings. These applications are briefly discussed in this paper.

Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract W-31-109-ENG-38. DMR91-20000. (CONF-950292–1: NRIM international seminar on superconductors in high magnetic fields, Tsukuba (Japan), 17-18 Feb 1995). Order Number DE95012079. Source: OSTI; NTIS; GPO Dep.

Twin boundaries provide a convenient defect for investigating vortex dynamics in superconductors. They occur naturally in $YBa_2Cu_3O_7$, with well defined planar geometries. They are a strong pinning defect, and at the temperature of the melting transition they are the dominant pinning sites in clean crystals. Twin boundaries are easily seen in polarized light, making their location and number directly observable without special equipment. Finally, they present a highly anisotropic pinning potential to the vortices, creating the possibility of interesting new behavior. In this paper, we describe experiments using twin boundaries to probe two effects in vortex dynamics: a new peak effect in the critical current occurring in the solid state just below the melting transition, and anisotropic pinning by planar defects.

22821 (CEA-CONF–11888) **High Tc superconductivity with polarons and bipolarons an approach from the insulating states.** Aubry, S. Laboratoire Leon Brillouin (LLB) - Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). 1994. 36p. (CONF-9404139–: Workshop on polarons and bipolarons in high Tc superconductors, Cambridge (United Kingdom), 7-9 Apr 1994). Order Number DE95632116. Source: OSTI; NTIS (US Sales Only); INIS.

After a review of the Holstein-Hubbard model, an approach for understanding bipolaronic superconductivity is proposed, which consists in discussing under which conditions the role of the quantum lattice fluctuations could increase sufficiently in order to favour a bipolaronic superfluid state instead of insulating bipolaronic or polaronic structures and reach perhaps an unusually large high Tc. For that purpose, situations where the direct electron-electron interaction competing with the electron phonon coupling, can break the standard bipolarons into polarons, are studied. If certain quantum fluctuations could become large enough, high Tc superconductivity could take place on the spin-Peierls state; it would be specifically the consequence of a sharply balanced competition between a strong electron-phonon coupling and a strong electron-electron repulsion. 9 figs., 31 refs.

22822 (LA-UR–94-1148, pp. 57-91) **Magnetism and superconductivity in heavy-electron metals.** Ott, H.R. (Laboratorium fuer Festkoerperphysik, Zuerich (Switzerland)). Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

All the data and features of properties of heavy-electron systems mentioned in this presentation represent only a fraction of recent results obtained in this field. Nevertheless they should demonstrate

that interesting physics may be explored in studies of these materials. Most results that are obtained are important with regard to the understanding of metals in general. These substances are suited for studies of all aspects of many-body effects among conduction electrons in metals and are an important link to quantum fluids or solids like ^{3}He. The quite well established occurrence of unconventional superconductivity is among the most prominent features of heavy-electron physics and, also here, provides a merging of interest with another hot topic of condensed-matter physics, the phenomenon of superconductivity in oxides at relatively high temperatures and in organic substances. As a final comment the author recalls the importance of the materials-science aspects in these problems. The demonstrated strong influence of small amounts of impurities or imperfections on the physical properties of these substances certainly deserves further attention in future experimental and theoretical work.

22823 (LA-UR–94-1148, pp. 106-132) **Fermi-liquid theory for unconventional superconductors.** Sauls, J.A. (Northwestern Univ., Evanston, IL (United States)). Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). Fermi liquid theory is used to generate the Ginzburg-Landau free energy functionals for unconventional superconductors belonging to various representations. The parameters defining the GL functional depend on Fermi surface anisotropy, impurity scattering and the symmetry class of the pairing interaction. As applications the author considers the basic models for the multiple superconducting phases of UPt_3. An important prediction of the leading order Fermi liquid theory for the two-dimensional representations of the hexagonal symmetry group is that the zero-field equilibrium state exhibits spontaneously broken time-reversal symmetry.

The authors present an overview of the experimental evidence for a role of the lattice in the mechanism of high-temperature superconductivity. It appears unlikely that a solely conventional electron-phonon interaction produces the pairing. However, there is ample evidence of strong electron and spin to lattice coupling and observations of a response of the lattice to the electronic state. They draw attention to the importance of the local structure in discussions of lattice effects in high-T_c superconductivity.

High temperature superconductors (HTSC) are perhaps the most extensively characterized materials of recent times. The average crystallographic structures have been determined by X-ray, neutron and electron diffraction techniques. Recent investigations using extended x-ray absorption fine structures (EXAFS) and pair distribution analysis (PDF), however, have shown that there are significant local deviations from the average crystallographic structure. These local structural anomalies have been observed in several systems, including $YBa_2Cu_3O_7$, $Nd_{2-x}Ce_xCuO_{4-y}$, $Bi_2Ca_2SrCu_2O_8$, and $TlBa_2Ca_3Cu_4O_{11}$. Comparison of the x-ray absorption near edge spectra (XANES) of several superconducting systems indicate that structural anomalies also exist in $Tl_2Ba_2CuO_6$ (2201), and these anomalies reduce the crystal symmetry. The authors interpret this lowering of symmetry as an indication of the existence of localized states in this structure. Powder EXAFS experiments on the Tl based superconductors, as well as preliminary EXAFS results on oriented samples support this conclusion.

22826 (LA-UR–94-1148, pp. 359-363) **Site-selective oxygen isotope shift in $YBa_2Cu_3O_7$.** Nickel, J.H. (Los Alamos National Laboratory, NM (United States)); Morris, D.E.; Ager, J.W. III. Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

$YBa_2Cu_3O_7$(123) has four inequivalent oxygen sites: the CuO chain sites [O1], the edge sharing apical sites [O4] and the CuO_2 plane sites [O2,O3]. In all previous isotope shift experiments, isotopic substition was nearly complete and uniform among the different oxygen sites. The measured oxygen isotope shift is ΔT_c = 0.2K for uniform ^{18}O occupation. These studies could not distinguish the contributions of the different oxygen sites to the oxygen isotope effect. The authors have measured the site selective oxygen isotope shift (SS-OIS) of 123 samples containing ~ 95% ^{18}O in the CuO_2 plane sites and primarily ^{16}O in the apical and chain sites.

22827 (LA-UR–94-1148, pp. 364-397) **Lattice and multi-band electronic effects in high-temperature superconductors.** Bishop, A.R. (Los Alamos National Laboratory, NM (United States)). Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

The large body of evidence for lattice anomalies and complex Fermi surface structures in layered high-temperature cuprate superconductors is briefly reviewed. Theoretical implications are discussed, focusing on: (i) Polaron tunneling as a non-linear, nonadiabatic model for multi-bondlength Cu-O distributions and associated optical and inelastic neutron scattering properties; (ii) Stoichiometric and doping states of a 3-band extended Peierls-Hubbard model for Cu-O planes; and (iii) Weak-coupling analysis of multigap-coupling arising from interband scattering in addition to conventional intraband scattering.

22828 (LA-UR–94-1148, pp. 405-409) **Effect of finite quasiparticle lifetime on the frequency dependence of phonon lifetimes in $d_{x^2-y^2}$ superconductors.** Coffey, D. (State Univ. of New York, Buffalo, NY (United States)); Coffey, L. Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

The frequency dependence of phonon lifetimes in a superconductor with a $d_{x^2-y^2}$ order parameter is investigated. The authors show that the inclusion of a finite quasiparticle lifetime due to impurity scattering and spontaneous quasiparticle decay smears features, recently proposed as signatures of d-wave superconductivity in cuprate superconductors. They show also that the tight-binding bandstructure leads to features at high frequencies associated with superconductivity. These features may serve as a new probe of the shape of the Fermi surface in cuprate superconductors.

22829 (LA-UR–94-1148, pp. 410-413) **Mott-induced structural transition in 2D metals electrons in the overdoped limit.** Rodriguez, J.P. (Los Alamos National Laboratory, NM (United States)). Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

It is well-known now that the conduction electrons in the Copper-Oxygen planes common to all high-temperature superconductors experience strong repulsive interactions. The simplest theoretical

description of this physics for electron densities approaching the antiferromagnetic Mott transition is given by the t-J model on the square-lattice, where double occupancy of electrons at each site is strictly excluded. This constraint may be imposed by the introduction of an auxiliary slave-boson field, b_i, such that the electron field is re-expressed as $c_{i\sigma} \rightarrow c_{i\sigma}b_i^\dagger$, along with the constraint $c_{i\sigma}^\dagger c_{i\sigma} + b_i^\dagger b_i = 1$ at each site. Certain mean-field treatments of the latter constraint allowing the slave-boson to propagate result in a spin-charge separated description of the t-J model in terms of a spinon field, $c_{i\sigma}$, and a holon field, b_i. A statistical gauge field, A_μ, generated by the internal gauge symmetry $(c_{i\sigma},b_i) \rightarrow (e^{i\theta_i}c_{i\sigma}, e^{i\theta_i}b_i)$ then mediates interactions between the two species. In particular, holon scattering off of gapless transverse gauge-field excitations results ultimately in a linear-in-T prediction for resistivity in the fluxless ("strange") metallic phase of the t-J model, which is a feature that is consistently observed in the normal phase of the oxide superconductors.

22830 (LA-UR–94-1148, pp. 417-469) **Experimental evidence for spin fluctuations in high temperature superconductors.** Slichter, C.P. (Univ. of Illinois, Urbana, IL (United States)). This paper was commissioned to provide background for a discussion session on issues raised by magnetic resonance studies of high temperature superconductors. It is intended to give a succinct summary and as clear an explanation as possible for the conference participants within prescribed page limitations. As a result, the author has not been able to describe all the important papers, or to give a thorough explanation of the contributions of the many scientists whose work was crucial in developing the concepts which it is important for the conferees to grasp. References are presented to give the reader an additional source to consult for a deeper discussion, or to select representative data to demonstrate a point. Many papers are omitted which would be needed were this paper intended as a history of developments.

22831 (LA-UR–94-1148, pp. 476-479) **A nearly antiferromagnetic Fermi liquid description of magnetic scaling and spin gap behavior in the cuprate superconductors.** Pines, D. (Department of Physics and Science and Technology Center for Superconductivity, Urbana, IL (United States)). Los Alamos National Lab., NM (United States). [1994]. Grant DMR 91-20000; Grant PHY 89-04035. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

The author describes briefly work-in progress with Philippe Monthoux on a Fermi liquid approach to magnetic scaling and spin gap behavior in the cuprate superconductors. The starting point is a generalized mean-field (RPA) description of the dynamic susceptibility, $\chi(q,\omega) = \tilde{\chi}(q,\omega)/(1 - f^{\alpha}_{q}(\omega)\tilde{\chi}(q,\omega))$, $\tilde{\chi}(q,\omega)$ is the irreducible particle-hole susceptibility and $f^{\alpha}_{q}(\omega)$ is a wavevector and frequency dependent mean field vertex correction.

22832 (LA-UR–94-1148, pp. 480-483) **What is the origin of ω/T scaling in the cuprate superconductors?.** Sokol, A. (Univ. of Illinois, Urbana, IL (United States)). Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

Quantum critical antiferromagnetic behavior is a candidate scenario for ω/T scaling of the q-integrated spin susceptibility in the underdoped high-T_c materials, which provides an explanation for the spin gap phenomenon and yields correct quantitative predictions for the nuclear relaxation and neutron scattering. It is likely that understanding the anomaolou normal state properties of the cuprate superconductors will allow one to gain insight into the origin of high temperature superconductivity.

22833 (LA-UR–94-1148, pp. 484-514) **Spin fluctuations and high temperature superconductors.** Rice, T.M. Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

The author reviews the phenomenological theory based on the nearly antiferromagnetic Fermi liquid ansatz and argues that the underlying assumption of almost criticality requires a strongly correlated microscopic model. With this in mind he then reviews the spin response properties of the t-J model. Lastly a discussion of the effect of breaking up the infinite planes into segments of ladders or clusters will give some new insights into open questions such as the origin of the spin gap and the role of quantum frustration of the magnetic order.

22834 (LA-UR–94-1148, pp. 530-534) **About superconductivity in electronic models for the high-T_c cuprates.** Dagotto, E. (Florida State Univ., Tallahassee, FL (United States)). Los Alamos National Lab., NM (United States). [1994]. Grant ONR N00014-93-1-0495. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

Some recent numerical results in the context of the two dimensional Hubbard and t-J models are briefly (and informally) summarized. Superconductivity in these models is discussed.

22835 (LA-UR–94-1148, pp. 535-540) **Spin and pairing correlations in a two-chain Hubbard model.** Noack, R.M. (Univ. of California, Irvine, CA (United States)); White, S.R.; Scalapino, D.J. Los Alamos National Lab., NM (United States). [1994]. Grant N00014-91-J-1143. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

Results for the equal-time spin and singlet pair field correlation functions for a two-chain Hubbard model are given. At half-filling, the dominant correlations are antiferromagnetic spin correlations characterized by a spin gap. When the system is doped away from half-filling, the antiferromagnetic correlations become incommensurate and the singlet pair field correlations appear to decay as ℓ^{-2}, similar to their U = 0 behavior. The authors have recently carried out numerical renormalization group calculations for a two-chain Hubbard model. Here they summarize what has been found for the equal-time spin and singlet pairing correlation functions for the case in which the inter and intra-chain hopping matrix elements are equal.

22836 (LA-UR–94-1148, pp. 541-544) **Impurities and conductivity in a D-wave superconductor.** Balatsky, A.V. (Los Alamos National Laboratory, NM (United States)). Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

It is well known that scalar impurities are pair breakers in d-wave and any other nontrivial pairing state superconductor. They produce a finite lifetime of the quasiparticles in the nodes of the gap, a finite density of states at low energy, and a finite low frequency conductivity at low temperatures, ignoring localization effects. For the special case of a 2D superconductor with a d-wave gap, a straight-forward calculation yields the suprising result that dc conductivity $\sigma(\omega \rightarrow 0)$ is a "universal" number, independent of the lifetime of quasiparticle (but dependent on the aniosotropy ratio of the velocities of the quasiparticle in the node of the gap). However, recent experiments on microwave absorption in YBCO crystals with Zn impurities show a linear temperature dependence of the conductivity for pure samples, evolving to the quadratic behavior for

higher impurity concentration, and low-temperature conductivity, inversely proportional to the impurity concentration.

22837 (LA-UR–94-1148, pp. 545-551) **The phase diagram and the spin gap state in cuprates: Gauge theory.** Lee, P.A. (Massachusetts Institute of Technology, Cambridge, MA (United States)). Los Alamos National Lab., NM (United States). [1994]. Grant DMR-90-22933. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

The author analyzes the phase diagram of single and bi-layer cuprates using the gauge-field description of the t-J model. For $T > T_{BE}$ the in-plane fermion-pairing order parameter $\Delta_{||}$ is eliminated by gauge field fluctuations, leading to the prediction of the absence of a spin-gap phase in single-layer cuprates. For bi-layer cuprates the interlayer order parameter $\Delta_{\perp}$ is enhanced by spin correlations, and is less affected by gauge fluctuations. The author believes that the spin gap in bi-layer materials is due to interlayer fermion pairing, and that for these underdoped samples the superconducting gap may be nodeless.

22838 (LA-UR–94-1148, pp. 556-559) **D-wave superconductivity with a gap.** Laughlin, R.B. (Stanford Univ., CA (United States)). Los Alamos National Lab., NM (United States). [1994]. Grant DMR-88-16217. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

Time-reversal symmetry breaking, the most important prediction of the "anyon" method for calculating properties of the t-J model, is not a dead concept in high-temperature superconductivity, despite the repeated failure to find T-violation experimentally. The authors believes that it may finally have been observed in experiments conducted for other purposes, and that previous failures to find it were due to pervasive dirt problems in the samples. The relevant measurements are the Josephson phase experiment of Wollman et al., which is discussed elsewhere in these proceedings, and the point-contact tunneling experiment of Hasegawa et al.

22839 (LA-UR–94-1148, pp. 563-593) **Theoretical framework for the normal state of copper oxide metals.** Varma, C.M. (AT&T Bell Laboratories, Murray Hill, NJ (United States)). Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

Every transport property in the normal metallic state of copper oxide based superconductive materials has a temperature dependence unlike that in other metals. For example, the electrical resistivity has a linear temperature dependence down to T_c and the thermal conductivity is very nearly a constant. Such long wavelength transport properties imply a transport relaxation rate τ^{-1} proportional to the temperature T. $\tau^{-1} \sim T$ can occur in metals in the classical range, for instance due to scattering from phonons or other excitations such as spin-waves at temperatures larger than their characteristic frequency. There are strong empirical and theoretical reasons, explained below, why this is not the case for copper oxide based metals. Then such a relaxation rate implies a breakdown of the quasiparticle concept. For the quasiparticle concept to hold the scattering rates must be much smaller than the energy, proportional to T, for thermal excitations. For instance, at low temperatures the scattering rate of normal metals due to electron-electron interactions is calculated and experimentally observed to be proportional to T^2, that due to electron-phonon scattering is no faster than T^3 (for 3-dimensional phonons), etc.

22840 (LA-UR–94-1148, pp. 605-608) **On the phase diagram of $La_{2-x}Sr_xCuO_4$.** Gor'kov, L.P. (National High Magnetic Field Laboratory, Tallahassee, FL (United States)); Kumar, P. Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

The authors suppose that the charge transfer gap decreases with doping resulting eventually in overlap between the electron and hole bands. The two frequencies seen in Cu NQR both in $La_{2-x}Sr_xCuO_4$ and in $La_2CuO_{4+\delta}$ are therefore ascribed to the presence of Cu configurations d^9 (local spin) and d^{10} (electrons). In an alternative approach to the three band model they find the positions for electron and hole pockets at the X and Γ points of the brillouin Zone, correspondingly.

22841 (LA-UR–94-1148, pp. 609-645) **Electronic phase separation and high temperature superconductors.** Kivelson, S.A. (UCLA, Los Angeles, CA (United States)); Emergy, V.J. Los Alamos National Lab., NM (United States). [1994]. DOE Contract AC02-76CH00016. Grant DMR-93-12606. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

The authors review the extensive evidence from model calculations that neutral holes in an antiferromagnet separate into hole-rich and hole-poor phases. All known solvable limits of models of holes in a Heisenberg antiferromagnet exhibit this behavior. They show that when the phase separation is frustrated by the introduction of long-range Coulomb interactions, the typical consequence is either a modulated (charge density wave) state or a superconducting phase. They then review some of the strong experimental evidence supporting an electronically-driven phase separation of the holes in the cuprate superconductors and the related Ni oxides. Finally they argue that frustrated phase separation in these materials can account for many of the anomalous normal state properties of the high temperature superconductors and provide the mechanism of superconductivity. In particular, they show that the T-linear resistivity of the normal state is a paraconductivity associated with a novel composite pairing, although the ordered superconducting state is more conventional.

22842 (LA-UR–94-1148, pp. 654-658) **Short coherence length superconductors: Intermediate regime between BCS and bosons.** Engelbrecht, J.R. (Los Alamos National Laboratory, NM (United States)); Randeria, M.; Sa de Melo, C. Los Alamos National Lab., NM (United States). [1994]. (CONF-931247–: Strongly correlated electronic materials, Los Alamos, NM (United States), 15-18 Dec 1993). In *Proceedings, strongly correlated electronic materials: The Los Alamos symposium 1993.* 662p. Order Number DE94009293. Source: OSTI; NTIS; INIS.

In the quest for gaining insight into the many unusual properties of the high T_c materials one can follow several complementary approaches. Instead of attempting to solve a microscopic model with strong Coulomb correlations, the authors philosophy here is to re-examine their understanding of conventional superconductors and their metallic normal states and to investigate how generalizations of the BCS pairing scenario may lead to unconventional properties.

6655 Direct Energy Conversion

22843 (FEI–2353) **Theoretical and numerical analysis of the thermionic converter idle regime.** Sidel'nikov, V.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 25p. (In Russian). Order Number DE95634592. Source: OSTI; NTIS (US Sales Only); INIS.

With help calculation of a single region TEC by the numerical model TEC TOR it had been produced semiempirical formula for the voltage of a single motion. Error of data interpolation by this formula do not excess ≈0.1 v. After that it has been carry out detailed analytical analysis of a single region in approximation of linear motion of electron temperature and plasma density in the interelectrode gap. It was determined, that voltage of a single region greatly depend on type of the subcollector jump of potential. This leads to unmonotonic dependence of a single motion voltage from collector work function. 5 refs.; 12 figs.

70 PLASMA PHYSICS AND FUSION

22844 (SAND–95-0447) **Plasma technology directory.** Ward, P.P.; Dybwad, G.L. Sandia National Labs., Albuquerque, NM (United States). 1 Mar 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95011577. Source: OSTI; NTIS; INIS; GPO Dep.

The Plasma Technology Directory has two main goals: (1) promote, coordinate, and share plasma technology experience and equipment within the Department of Energy; and (2) facilitate technology transfer to the commercial sector where appropriate. Personnel are averaged first by Laboratory and next by technology area. The technology areas are accelerators, cleaning and etching deposition, diagnostics, and modeling.

Fluctuation-induced dynamo forces are measured over a wide range of electron collisionality in the edge of TPE-1RM20 Reversed-Field Pinch (RFP). In the collisionless region the Magnetohydrodynamic (MHD) dynamo alone can sustain the parallel current, while in the collisional region a new dynamo mechanism resulting from the fluctuations in the electron diamagnetic drift becomes dominant. A comprehensive picture of the RFP dynamo emerges by combining with earlier results from MST and REPUTE RFPs.

22846 (DOE/ER/54241–138) **Single Langmuir probe characteristic in a magnetized plasma at the text tokamak.** Jachmich, S. Texas Univ., Austin, TX (United States). Fusion Research Center. May 1995. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-94ER54241. (FRCR–456). Order Number DE95012144. Source: OSTI; NTIS; INIS; GPO Dep.

A single Langmuir probe tip was used at TEXT-Upgrade to obtain I-V characteristics in a magnetized plasma. Noisy data were reduced by a boxcar-averaging routine. Unexpected effects, namely nonsaturation of ion current, hysterises in the characteristics and I(V)-data were observed, which are in disagreement to the common single probe model. A double probe model allows parameterization of the I(V) curves and to determine the plasma properties in the scrape-off layer. It is shown in this model that a Langmuir probe does perturb the local space potential in the plasma. Comparisons were made with the triple probe technique of measuring temperatures. The nonsaturation of ion current leads to an error in the triple probe technique of order 20%.

22847 (DOE/ET/53088–703) **Studies of impurity mode and ITG mode in toroidal plasmas.** Dong, J.Q. (Southwest Inst. of Physics, Chengdu, SC (China)); Horton, W. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Apr 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–703). Order Number DE95012134. Source: OSTI; NTIS; INIS; GPO Dep.

The impurity mode and η_i mode driven by impurity ions with outwardly peaked density profiles, just as it is at the boundary of tokamak plasmas, and the ion temperature gradient, respectively, are studied in high temperature toroidal plasmas. The gyrokinetic theory is applied and finite Larmor radius effects of both hydrogenic and impurity ions are included. It is found that the impurity mode is enhanced by the ion temperature gradient. In addition, the impurity ions with outwardly peaked density profiles are demonstrated to have destabilizing effects on the η_i mode. These two modes are strongly coupled to each other so that it is impossible to distinguish between them when both the driving mechanisms axe strong enough to drive the corresponding mode unstable independently. The correlation of the results with nonlinear simulations and the experimental observations are discussed.

22848 (DOE/ET/53088–707) **Nonlinear instability and chaos in plasma wave-wave interactions. II. Numerical methods and results.** Kueny, C.S.; Morrison, P.J. Texas Univ., Austin, TX (United States). Fusion Research Center. May 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–707). Order Number DE95013474. Source: OSTI; NTIS; GPO Dep.

In Part I of this work and Physics of Plasmas, June 1995, the behavior of linearly stable, integrable systems of waves in a simple plasma model was described using a Hamiltonian formulation. It was shown that explosive instability arises from nonlinear coupling between modes of positive and negative energy, with well-defined threshold amplitudes depending on the physical parameters. In this concluding paper, the nonintegrable case is treated numerically. Several sets of waves are considered, comprising systems of two and three degrees of freedom. The time evolution is modelled with an explicit symplectic integration algorithm derived using Lie algebraic methods. When initial wave amplitudes are large enough to support two-wave decay interactions, strongly chaotic motion destroys the separatrix bounding the stable region for explosive triplets. Phase space orbits then experience diffusive growth to amplitudes that are sufficient for explosive instability, thus effectively reducing the threshold amplitude. For initial amplitudes too small to drive decay instability, small perturbations might still grow to arbitrary size via Arnold diffusion. Numerical experiments do not show diffusion in this case, although the actual diffusion rate is probably underestimated due to the simplicity of the model.

22849 (EUR-CEA-FC–1507) **Theory and experiments on RF plasma heating, current drive and profile control in TORE SUPRA.** Moreau, D. Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee. Jan 1994. 42p. (CONF-931178–: 5. international Toki conference on plasma physics and controlled nuclear fusion: physics and technology of plasma heating and current drive, Toki (Japan), 16-19 Nov 1993). Source: OSTI; NTIS (US Sales Only); INIS.

This paper reviews the main experimental and theoretical achievements related to the study of RF heating and non-inductive current drive and particularly phenomena related to the current density profile control and the potentiality of producing stationary enhanced performance regimes: description of the Lower Hybrid (LH) and Ion Cyclotron Resonant Frequency (ICRF) systems; long pulse coupling performance of the RF systems; observation of the transition to the so-called "stationary LHEP regime" in which the (flat) central current density and (peaked) electron temperature profiles are fully decoupled; experiments on ICRF sawtooth stabilization with the combined effect of LHCD modifying the current density profile; diffusion of fast electrons generated by LH waves; ramp-up experiments in which the LH power provided a significant part of the resistive poloidal flux and flux consumption scaling; theory of spectral wave diffusion and multipass absorption; fast wave current drive modelling with the Alcyon full wave code; a reflector LH antenna concept. 18 figs., 48 refs.

22851 (LA-UR–95-1333) **SDOSS: A spatially discriminating, optical streaked spectrograph.** Cobble, J.; Evans, S.; Fernandez, J.; Oertel, J.; Watt, R.; Wilde, B. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington,

DC (United States). DOE Contract W-7405-ENG-36. (CONF-950476–1: 12. international conference on laser interaction and related plasma phenomena, Osaka (Japan), 24-28 Apr 1995). Order Number DE95012068. Source: OSTI; NTIS; INIS; GPO Dep.

SDOSS is employed to study broadband laser scattering encompassing SBS, SRS, and the 3/2-ω signature of two plasmon decay for ns-scale laser-plasma experiments with 351 or 527-nm drive. It uses a Cassegrain telescope to image scattered light from a laser plasma onto a field stop. The telescope magnification and the stop aperture provide spatial discrimination of target plane scatter. A UV lens relays the image to a 0.25-m spectrograph which is lens coupled to a streak camera with an S-1 photocathode. The streak output is imaged onto a CCD camera. In its 512 x 480 pixel array, the CCD covers a spectral range from 200 to 800 nm with 4-nm resolution and can be adjusted to look from 350 to 1,060 nm. The sweep speed is variable with full window values of 30, 12, 6 ns, and faster. An optical fiducial provides a spectral and temporal marker. On the Livermore Nova laser, SDOSS has been used to determine spatial density in gas-filled hohlraums from SRS signals. At Trident in Los Alamos, it has been employed for similar measurements with long scale length plasmas in SBS and SRS seeding experiments. It has proven to be a versatile tool for studying the physics of laser-generated plasmas.

22852 (NIFS–311) **Current-profile flattening and hot core shift due to the nonlinear development of resistive kink mode.** Watanabe, Kunihiko; Sato, Tetsuya; Nakayama, Yuichiro. National Inst. for Fusion Science, Nagoya (Japan). Oct 1994. 29p. Order Number DE95780476. Source: OSTI; NTIS; INIS.

A new and interesting phenomenon showing that the toroidal current profile for the n=0 mode, which at first exhibits a peak due to ohmic heating and later flattens around the magnetic axis, is obtained through a compressible resistive MHD simulation in a fully 3-D toroidal geometry. We conclude through a detailed analysis that the current flattening is caused by the strong excitation of a nonlinear resistive kink mode. The time-scale of the current profile flattening is of the order of the MHD time-scale. When the current profile is largely flattened, the plasma dynamic pressure due to the strongly excited kink mode pushes the hot core plasma in the radial kink flow direction and the hot core starts deviating from the magnetic surface because of the plasma compressibility and the dynamic pressure. Since the flattening of a current profile weakens the shear effect of the poloidal magnetic field in the $q<1$ region where the resistive kink mode is growing, the poloidal magnetic field reconnection is driven by the strong kink flow and leads to complete destruction of the magnetic surface within the q=1 rational surface (minor disruption), and the poloidal magnetic field configuration recovers to an axi-symmetric profile. The effect of the thermal conduction on the evolution of such a process is also discussed. (author).

22853 (NIFS–312) **Modification and damping of Alfven waves in a magnetized dusty plasma.** Salimullah, M.; Dasgupta, B.; Watanabe, K.; Sato, T. National Inst. for Fusion Science, Nagoya (Japan). Oct 1994. 20p. Order Number DE95780463. Source: OSTI; NTIS; INIS.

The dispersion characteristics of the circularly polarized electromagnetic waves along a homogeneous magnetic field in a dusty plasma have been investigated theoretically. The Vlasov equation has been employed to find the response of the magnetized plasma particles where the dust grains form a static background of highly charged and massive centers having certain correlation. It is found that in addition to the usual Landau damping which is negligible in the low temperature approximation, a novel mechanism of damping of the Alfven waves due to the dust comes into play. The modification and damping of the Alfven waves depend on the dust perturbation parameters, unequal densities of plasma particles, the average correlation length of the dust grains, temperature of the plasma and the magnetic field. (author).

22854 (NIFS–313) **Physical mechanism determining the radial electric field and its radial structure in a toroidal plasma.** Ida, Katsumi (and others); Miura, Yukitoshi; Itoh, Sanae. National Inst. for Fusion Science, Nagoya (Japan). Oct 1994. 67p. Order Number DE95780475. Source: OSTI; NTIS; INIS.

Radial structures of plasma rotation and radial electric field are experimentally studied in tokamak, heliotron/torsatron and stellarator devices. The perpendicular and parallel viscosities are measured. The parallel viscosity, which is dominant in determining the toroidal velocity in heliotron/torsatron and stellarator devices, is found to be neoclassical. On the other hand, the perpendicular viscosity, which is dominant in dictating the toroidal rotation in tokamaks, is anomalous. Even without external momentum input, both a plasma rotation and a radial electric field exist in tokamaks and heliotrons/torsatrons. The observed profiles of the radial electric field do not agree with the theoretical prediction based on neoclassical transport. This is mainly due to the existence of anomalous perpendicular viscosity. The shear of the radial electric field improves particle and heat transport both in bulk and edge plasma regimes of tokamaks. (author) 95 refs.

22855 (NIFS–314) **Non-Taylor magnetohydrodynamic self-organization.** Zhu, Shao-ping; Horiuchi, Ritoku; Sato, Tetsuya. National Inst. for Fusion Science, Nagoya (Japan). Oct 1994. 45p. Order Number DE95780464. Source: OSTI; NTIS; INIS.

A self-organization process in a plasma with a finite pressure is investigated by means of a three-dimensional magnetohydrodynamic simulation. It is demonstrated that a non-Taylor finite β self-organized state is realized in which a perpendicular component of the electric current is generated and the force-free(parallel) current decreases until they reach to almost the same level. The self-organized state is described by an MHD force-balance relation, namely, $j_{perpendicular} = B \times \nabla p/B \cdot B$ and $j_{parallel} = \mu B$ where μ is not a constant, and the pressure structure resembles the structure of the toroidal magnetic field intensity. Unless an anomalous perpendicular thermal conduction arises, the plasma cannot relax to a Taylor state but to a non-Taylor (non-force-free) self-organized state. This state becomes more prominent for a weaker resistivity condition. The non-Taylor state has a rather universal property, for example, independence of the initial β value. Another remarkable finding is that the Taylor's conjecture of helicity conservation is, in a strict sense, not valid. The helicity dissipation occurs and its rate slows down critically in accordance with the stepwise relaxation of the magnetic energy. It is confirmed that the driven magnetic reconnection caused by the nonlinearly excited plasma kink flows plays the leading role in all of these key features of the non-Taylor self-organization. (author).

22856 (NIFS–315) **Collisionless magnetic reconnection associated with coalescence of flux bundles.** Tanaka, Motohiko. National Inst. for Fusion Science, Nagoya (Japan). Nov 1994. 40p. Order Number DE95780473. Source: OSTI; NTIS; INIS.

The basic process of collisionless reconnection is studied in terms of coalescence of magnetized flux bundles using an implicit particle simulation of two-dimensions. The toroidal electric field that directly relates to magnetic reconnection is generated solenoidally in a region much broader than the current sheet whose width is a few electron skin depths. The reconnected flux increases linearly in time, but it is insensitive to finite Larmor radii of the ions in this Sweet-Parker regime. The toroidal electric field is controlled by a balance of transit acceleration of finite-mass electrons and their removal by sub-Alfvenic E x B drift outflow. The simulation results supports the collisionless Ohm's law $E_t \simeq \eta_{eq} J_t$ with η_{eq} the inertia resistivity. (author).

22857 (NIFS–316) **Macro-EM particle simulation method and a study of collisionless magnetic reconnection.** Tanaka, Motohiko. National Inst. for Fusion Science, Nagoya (Japan). Nov 1994. 48p. Order Number DE95780465. Source: OSTI; NTIS; INIS.

A multi-dimensional electromagnetic particle simulation method which is suitable for studying low-frequency plasma phenomena is described in the first part. Its application to collisionless magnetic reconnection is shown in the second part. The present particle code efficiently deals with nonlinear kinetic processes wherein ions and electrons play their roles, since the code is implemented using the Maxwell equations and the Newton-Lorentz equations. The drift-kinetic equations are used optionally. A simulation of collisionless reconnection shows that the toroidal electric field which directly relates to reconnection is generated naturally in the kinetic study, and that a thin dissipation region is formed whose width is a

few electron skin depth. Thus, collisionless reconnection is considered to proceed under the electron inertia. (author).

22858 (NIFS–317) **Second order focusing property of 210deg cylindrical energy analyzer.** Fujisawa, A.; Iguchi, H.; Sasao, M.; Hamada, Y. National Inst. for Fusion Science, Nagoya (Japan). Nov 1994. 21p. Order Number DE95780470. Source: OSTI; NTIS; INIS.

It was confirmed experimentally that a 210deg cylindrical energy analyzer with drift spaces has second order focusing. The properties of the analyzer is deeply dependent on the fringing field around the entrance and exit of the cylinders. (author).

22859 (NIFS–318) **Complexity in plasma. A grand view of self-organization.** Sato, Tetsuya. National Inst. for Fusion Science, Nagoya (Japan). Nov 1994. 28p. Order Number DE95780478. Source: OSTI; NTIS; INIS.

The central theme of the Complexity is the inquest of the creation of ordered structure in nature. Extensive computer simulations on plasmas have revealed that self-organization is governed by the three key processes, i.e. energy pumping, entropy expulsion and nonlinearity. A system exhibits characteristically different self-organization, depending on whether the energy pumping is instantaneous or continuous, or whether the produced entropy is expulsed or reserved. The nonlinearity acts to bring a nonequilibrium state into a bifurcation, thus resulting in a new structure along with an anomalous entropy production. (author).

22860 (NIFS–319) **MHD-Vlasov simulation of the toroidal Alfven eigenmode.** Todo, Y.; Sato, T.; Watanabe, K.; Watanabe, T.H.; Horiuchi, R. National Inst. for Fusion Science, Nagoya (Japan). Nov 1994. 30p. Order Number DE95780471. Source: OSTI; NTIS; INIS.

A new simulation method has been developed to investigate the excitation and saturation processes of toroidal Alfven eigenmodes (TAE modes). The background plasma is described by a full-MHD fluid model, while the kinetic evolution of energetic alpha particles is followed by the drift kinetic equation. The magnetic fluctuation of $n = 2$ mode develops and saturates at the level of 1.8×10^{-3} of the equilibrium field when the initial beta of alpha particles is 2% at the magnetic axis. After saturation, the TAE mode amplitude shows an oscillatory behavior with a frequency corresponding to the bounce frequency of the alpha particles trapped by the TEA mode. The decrease of the power transfer rate from the alpha particles to the TAE mode, which is due to the trapped particle effect of a finite-amplitude wave, causes the saturation. From the linear growth rate the saturation level can be estimated. (author).

22861 (NIFS–321) **Theory of pressure-induced islands and self-healing in three-dimensional toroidal magnetohydrodynamic equilibria.** Bhattacharjee, A.; Hayashi, T.; Hegna, C.C.; Nakajima, N.; Sato, T. National Inst. for Fusion Science, Nagoya (Japan). Nov 1994. 26p. Order Number DE95780472. Source: OSTI; NTIS; INIS.

The role of singular currents in three-dimensional toroidal equilibria and their resolution by magnetic island formation is discussed from both analytical and computational points of view. Earlier analytical results are extended to include small vacuum islands which may, in general, have different phases with respect to pressure-induced islands. In currentless stellarators, the formation of islands is shown to depend on the resistive parameter D_R as well as the integrated effect of global Pfirsch-Schlueter currents. It is demonstrated that the pressure-induced 'self-healing' effect, recently discovered computationally, is also predicted by analytical theory. (author).

22862 (NIFS–327) **Fast potential change in sawteeth in JIPP T-IIU tokamak plasmas.** Hamada, Y. (and others); Nishizawa, A.; Kawasumi, Y. National Inst. for Fusion Science, Nagoya (Japan). Dec 1994. 26p. Order Number DE95780468. Source: OSTI; NTIS; INIS.

Fast changes of electric potential with different polarities are observed during sawtooth oscillation in a core region of a tokamak plasma using a heavy ion beam probe. The potential change inside the inversion radius is found to be positive. The change is negative outside the inversion radius and shows clearly a propagation nature. The observed potential can be interpreted by the mixture of the potentials of two origins. One of them drives the fast MHD plasma motion through E/B drift and the other is a barrier potential induced by mixing of hot and cold plasmas at sawtooth crash. (author).

22863 (NIFS–328) **Effect of satellite helical harmonics on the stellarator configuration.** Pustovitov, V.D. National Inst. for Fusion Science, Nagoya (Japan). Dec 1994. 46p. Order Number DE95780477. Source: OSTI; NTIS; INIS.

We discuss the problem of self-consistent analytical description of stellarators with a helical field which has, besides the main harmonic, two nearest satellites with the same period in the toroidal angle. The expression for the flux function explicitly incorporating the effect of such satellites on the shape of magnetic surfaces is obtained. It is shown that they produce the shift of magnetic surfaces. The expression for this shift is derived. Two problems are considered where the behavior of B^2 on a magnetic surface is important: Pfirsch-Schlueter current at the presence of satellites and possibility of fulfillment of quasisymmetry condition (B^2 on a magnetic surface does not depend on one of the angular Boozer coordinates) at least at a single magnetic surface. It is shown that effect of satellite harmonics on the magnitude of Pfirsch-Schlueter current turns out to be much smaller than it was predicted earlier on the basis of simplified model where the shift related with satellites was not taken into account. It is shown that quasisymmetry condition in a configuration with two satellites can be fulfilled only in linear approximation in helical field. The analysis is performed for conventional stellarators with planar circular axis making use of stellarator expansion. (author) 54 refs.

22864 (NIFS-MEMO–15) **Study on sawtooth and transport. A report of Japan-TEXTOR collaboration.** Itoh, S. (Kyushu Univ., Kasuga, Fukuoka (Japan). Research Inst. for Applied Mechanics); Itoh, K.; Soltwisch, H.; Finken, K.H. National Inst. for Fusion Science, Nagoya (Japan). Jan 1995. 24p. (In Japanese, English). Order Number DE95780474. Source: OSTI; NTIS; INIS.

A collaboration programme is initiated, in part of the Japan-TEXTOR collaboration, for the theoretical and experimental study on the sawtooth and anomalous transport. The summary of the workshop in 1994 is reported. (author).

22865 (PPPL–3108) **Absolute calibration of TFTR helium proportional counters.** Strachan, J.D. (Princeton Univ., NJ (United States). Plasma Physics Lab.); Diesso, M.; Jassby, D.; Johnson, L.; McCauley, S.; Munsat, T.; Roquemore, A.L.; Barnes, C.W.; Loughlin, M. Princeton Univ., NJ (United States). Plasma Physics Lab. Jun 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (CONF-940552–47: 10. topical conference on high-temperature plasma diagnostics, Rochester, NY (United States), 8-12 May 1994). Order Number DE95013483. Source: OSTI; NTIS; INIS; GPO Dep.

The TFTR helium proportional counters are located in the central five (5) channels of the TFTR multichannel neutron collimator. These detectors were absolutely calibrated using a 14 MeV neutron generator positioned at the horizontal midplane of the TFTR vacuum vessel. The neutron generator position was scanned in centimeter steps to determine the collimator aperture width to 14 MeV neutrons and the absolute sensitivity of each channel. Neutron profiles were measured for TFTR plasmas with time resolution between 5 msec and 50 msec depending upon count rates. The He detectors were used to measure the burnup of 1 MeV tritons in deuterium plasmas, the transport of tritium in trace tritium experiments, and the residual tritium levels in plasmas following 50:50 DT experiments.

22866 (UCRL-ID–120004) **LDRD Final report.** Stewart, R.E.; Price, D.; Shepherd, R.; White, W.; Walling, R.; More, R. Lawrence Livermore National Lab., CA (United States). 16 Mar 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012110. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of this project is to develop a 100-fs pulse length laser capable of heating solid density plasmas to near-kilovolt temperatures before hydrodynamic decompression of the target can take

place, and to experimentally determine the properties of these plasmas with it. The authors have successfully developed the laser for this work and measured plasma production and laser absorption with it. This work has demonstrated the capacity to produce solid-density plasmas. Future experiments are described.

22867 (UCRL-ID–120116) **UEDGE code comparisons with DIII-D bolometer DATA.** Daniel, J.M. Lawrence Livermore National Lab., CA (United States); General Atomics, San Diego, CA (United States). Jan 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ; AC03-89ER51114. Order Number DE95013294. Source: OSTI; NTIS; GPO Dep.

This paper describes the work done to develop a bolometer post processor that converts volumetric radiated power values taken from a UEDGE solution, to a line integrated radiated power along chords of the bolometers in the DIII-D tokamak. The UEDGE code calculates plasma physics quantities, such as plasma density, radiated power, or electron temperature, and compares them to actual diagnostic measurements taken from the scrape off layer (SOL) and divertor regions of the DIII-D tokamak. Bolometers are devices measuring radiated power within the tokamak. The bolometer interceptors are made up of two complete arrays, an upper array with a vertical view and a lower array with a horizontal view, so that a two dimensional profile of the radiated power may be obtained. The bolometer post processor stores line integrated values taken from UEDGE solutions into a file in tabular format. Experimental data is then put into tabular form and placed in another file. Comparisons can be made between the UEDGE solutions and actual bolometer data. Analysis has been done to determine the accuracy of the plasma physics involved in producing UEDGE simulations.

22868 (UCRL-JC–118380) **Micron-scale resolution radiography of laser-accelerated and laser-exploded foils using an yttrium x-ray laser.** Cauble, R.; Da Silva, L.B.; Barbee, T.W. Jr.; Celliers, P.; Moreno, J.C.; Mrowka, S.; Perry, T.S.; Wan, A.S. Lawrence Livermore National Lab., CA (United States). Sep 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940592–11: 4. international colloquium on X-ray lasers, Williamsburg, VA (United States), 16-20 May 1994). Order Number DE95010922. Source: OSTI; NTIS; INIS; GPO Dep.

The authors have imaged laser-accelerated foils and exploding foils on the few-micron scale using an yttrium x-ray laser (155 Å, 80 eV, ~200 ps duration) and a multilayer mirror imaging system. At the maximum magnification of 30, resolution was of order one micron. The images were side-on radiographs of the foils. Accelerated foils showed significant filamentation on the rear-side (away from the driving laser) of the foil, although the laser beam was smoothed. In addition to the narrow rear-side filamentation, some shots revealed larger-scale plume-like structures on the front (driven) side of the Al foil. These plumes seem to be little-affected by beam smoothing and are likely a consequence of Rayleigh-Taylor instability. The experiments were carried out at the Nova two-beam facility.

22869 (UCRL-JC–119283) **A comparison of fundamental and second harmonic inside launch ECCD in the presence of a DC electric field.** James, R.A. (Lawrence Livermore National Lab., CA (United States)); Petty, C.C.; Harvey, R.W. Lawrence Livermore National Lab., CA (United States); General Atomics, San Diego, CA (United States). 6 Jan 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ; AC03-89ER51114. (GA--A21994; CONF-950112–2: 9. joint workshop on electron cyclotron emission and electron cyclotron resonance heating, Borrego Springs, CA (United States), 23-26 Jan 1995). Order Number DE95009847. Source: OSTI; NTIS; GPO Dep.

Using inside launch, both fundamental and second harmonic Electron Cyclotron Current Drive (ECCD) experiments have been performed in the DIII-D tokamak. Rf currents up to 100 kA have been driven using launched powers up to 1.1 MW. These experiments are characterized by thermal target plasmas with electron temperatures and densities sufficient to result in strong localized deposition of the rf power and good confinement of the rf generated current carriers. A residual dc electric field significantly enhances the current drive efficiency above that predicted by linear theory. The effects of the residual dc electric field are evaluated using a bounce averaged 3D Fokker-Planck code to model the experimental data. For both fundamental and second harmonic ECCD, the measured rf current drive efficiency is found to increase with the residual dc electric field in accordance with theoretical predictions.

22870 (UCRL-JC–119826) **The development of a distributed computing environment for the design and modeling of plasma spectroscopy experiments.** Nash, J.K. (Lawrence Livermore National Lab., CA (United States)); Eme, W.G.; Lee, R.W.; Salter, J.M. Lawrence Livermore National Lab., CA (United States). Oct 1994. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9410314–3: 6. international workshop on radiative properties of hot dense matter, Sarasota, FL (United States), 31 Oct - 4 nov 1994). Order Number DE95011725. Source: OSTI; NTIS; INIS; GPO Dep.

The design and analysis of plasma spectroscopy experiments can be significantly complicated by relatively routine computational tasks arising from the massive amount of data encountered in the experimental design and analysis stages of the work. Difficulties in obtaining, computing, manipulating and visualizing the information represent not simply an issue of convenience – they have a very real limiting effect on the final quality of the data and on the potential for arriving at meaningful conclusions regarding an experiment. We describe ongoing work in developing a portable UNIX environment shell with the goal of simplifying and enabling these activities for the plasma-modeling community. Applications to the construction of atomic kinetics models and to the analysis of x-ray transmission spectroscopy will be shown.

22871 (UCRL-JC–121089) **Stability of the DSI algorithm on a chevron grid.** Brandon, S.T.; Rambo, P.W. Lawrence Livermore National Lab., CA (United States). Jun 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950612–1: 22. international conference on plasma science, Madison, WI (United States), 5-8 Jun 1995). Order Number DE95013790. Source: OSTI; NTIS; INIS; GPO Dep.

The development of time domain electromagnetic solvers for nonorthogonal grids is an area of current research interest, stemming from the need to simulate complex geometries in a wide variety of applications. A notable example is the discrete surface integral (DSI) algorithm which solves the Maxwell curl equations in the time domain using a 3d, unstructured, mixed-polyhedral grid. Although this method is an extension of the time proven Yee algorithm, little is known about the numerical properties of the method when discretized on these more general grids. Dispersion relations for the DSI algorithm can be derived using 2d idealized grids, such as the skewed mesh analysis done by Ray and Rambo for both triangles and quadrilaterals. The present work applies the same techniques used for the skewed mesh analysis to another idealized, but nonorthogonal, 2d grid.

22872 (ANL/ET/CP–83726) **Fabrication of intermetallic coatings for electrical and corrosion resistance on high-temperature alloys.** Park, J.H. (Argonne National Lab., IL (United States)); Cho, W.D. Argonne National Lab., IL (United States). Oct 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950201–18: Annual meeting and exhibition of the Minerals, Metals and Materials Society (TMS), Las Vegas, NV (United States), 12-16 Feb 1995). Order Number DE95012947. Source: OSTI; NTIS; GPO Dep.

Several intermetallic films were fabricated to high-temperature alloys (V-alloys and 304 and 316 stainless steels) to provide electrical insulation and corrosion resistance. Alloy grain-growth behavior at 1000°C for the V-5Cr-5Ti was investigated to determine the stability of alloy substrate during coating formation by chemical vapor deposition (CVD) or metallic vapor processes at 800-850°C. Film layers were examined by optical and scanning electron microscopy and by electron-energy-dispersive and X-ray diffraction analysis

and tested for electrical resistivity and corrosion resistance. The results elucidated the nature of the coatings, which provided both electrical insulation and high-temperature corrosion protection.

22873 (ANL/ET/CP–84955) **Self-healing of defects in CaO coatings on V-5%Cr-5%Ti in liquid lithium.** Park, J.H.; Kassner, T.F. Argonne National Lab., IL (United States). Nov 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950518–10: 187. meeting of the Electrochemical Society, Reno, NV (United States), 21-26 May 1995). Order Number DE95013468. Source: OSTI; NTIS; INIS; GPO Dep.

In-situ electrical resistance of CaO coatings produced on V-5%Cr-5%Ti by exposure of the alloy to liquid Li that contained 0.5-85 wt % dissolved Ca was measured as a function of time at temperatures between 250 and 600°C. Examination of the specimens after cooling to room temperature revealed no spallation, but homogeneous crazing cracks were present in the CaO coating. Additional tests to investigate the in-situ self-healing behavior of the cracks indicated that rapid healing occurred at >360°C.

A key feasibility issue for the ITER Vanadium/Lithium breeding blanket is the question of insulator coatings. Design calculations show that an electrically insulating layer is necessary to maintain an acceptably low MHD pressure drop. To begin experimental investigations of the MHD performance of candidate insulator materials and the technology for putting them in place, a new test section was prepared. Aluminum oxide was chosen as the first candidate insulating material because it may be used in combination with NaK in the ITER vacuum vessel and/or the divertor. Details on the methods used to produce the aluminum oxide layer as well as the microstructures of the coating and the aluminide sublayer are presented and discussed. The overall MHD pressure drop, local MHD pressure gradient, local transverse MHD pressure difference, and surface voltage distributions in both the circumferential and the axial directions are reported and discussed. The positive results obtained here for high-temperature NaK have two beneficial implications for ITER. First, since NaK may be used in the vacuum vessel and/or the divertor, these results support the design approach of using electrically insulating coatings to substantially reduce MHD pressure drop. Secondly, while Al_2O_3/SS is not the same coating/base material combination which would be used in the advanced blanket, this work nonetheless shows that it is possible to produce a viable insulating coating which is stable in contact with a high temperature alkali metal coolant.

22875 (CONF-950506–14) **Tritium proof-of-principle pellet injector - phase II.** Fisher, P.W.; Gouge, M.J. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 5. topical meeting on tritium technology in fission, fusion and isotopic applications; Ispra (Italy); 28 May - 3 jun 1995. Order Number DE95013217. Source: OSTI; NTIS; INIS; GPO Dep.

As part of the International Thermonuclear Engineering Reactor (ITER) plasma fueling development program, Oak Ridge National Laboratory (ORNL) has fabricated a pellet injection system to test the mechanical and thermal properties of extruded tritium. This repeating, single-stage, pneumatic injector, called the Tritium-Proof-of-Principle Phase II (TPOP-II) Pellet Injector, has a piston-driven mechanical extruder and is designed to extrude hydrogenic pellets sized for the ITER device. The TPOP-II program has the following development goals: evaluate the feasibility of extruding tritium and DT mixtures for use in future pellet injection systems; determine the mechanical and thermal properties of tritium and DT extrusions; integrate, test and evaluate the extruder in a repeating, single-stage light gas gun sized for the ITER application (pellet diameter ~ 7-8 mm); evaluate options for recycling propellant and extruder exhaust gas; evaluate operability and reliability of ITER prototypical fueling systems in an environment of significant tritium inventory requiring secondary and room containment systems. In initial tests with deuterium feed at ORNL, up to thirteen pellets have been extruded at rates up to 1 Hz and accelerated to speeds of order 1.0-1.1 km/s using hydrogen propellant gas at a supply pressure of 65 bar. The pellets are typically 7.4 mm in diameter and up to 11 mm in length and are the largest cryogenic pellets produced by the fusion program to date. These pellets represent about a 11% density perturbation to ITER. Hydrogenic pellets will be used in ITER to sustain the fusion power in the plasma core and may be crucial in reducing first wall tritium inventories by a process called isotopic fueling where tritium-rich pellets fuel the burning plasma core and deuterium gas fuels the edge.

22876 (DOE/ER/52149–3) **[Fluid dynamics of supercritical helium within internally cooled cabled superconductors. Annual report].** Van Sciver, S.W. Wisconsin Univ., Madison, WI (United States). [1990]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER52149. Order Number DE95012153. Source: OSTI; NTIS; GPO Dep.

The Applied Superconductivity Center of the University of Wisconsin-Madison proposes to conduct research on low temperature helium fluid dynamics as it applies to the cooling of internally cooled cabled superconductors. Such conductors are used in fusion reactor designs including most of the coils in ITER. The proposed work is primarily experimental involving measurements of transient and steady state pressure drop in a variety of conductor configurations. Both model and prototype conductors for actual magnet designs will be investigated. The primary goal will be to measure and model the friction factor for these complex geometries. In addition, an effort will be to study transient processes such as heat transfer and fluid expulsion associated with quench conditions.

22877 (DOE/ER/52149–T1) **Final report on fluid dynamics of supercritical helium within cable-in-conduit conductors.** Van Sciver, S.W. Wisconsin Univ., Madison, WI (United States). 1 Jul 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER52149. Order Number DE95012147. Source: OSTI; NTIS; GPO Dep.

The enclosed report summarizes work carried out under DOE/MFE support during the past four years. Emphasis is placed on progress during the last year. Results of experiments on pressure drop and heat transfer within several Cable-in-Conduit conductors are described. These results are compared to models developed for flow in similar geometries. The work provides a basis for design of magnets using CIC conductors in fusion magnetic systems.

22878 (DOE/ER/54176–T1) **TRAP - Tokamak Refueling by Accelerated Plasmoids. Annual progress report No. 3, August 7, 1994–August 6, 1995.** Hoffman, A.L.; Slough, J.T. Washington Univ., Seattle, WA (United States). Aerospace and Energetics Research Program. [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-92ER54176. Order Number DE95009925. Source: OSTI; NTIS; INIS; GPO Dep.

This is the annual progress report for the period August 7, 1994 to August 6, 1995. This project is to demonstrate the ability to generate, accelerate, and inject plasmoids into a tokamak type magnetic geometry with the purpose being plasma fueling. The hardware has been assembled and constructed. Early test results have shown some unexpected problems which have been addressed. These and other delivery problems have extended the assembly phase and the authors are requesting a six month extension to allow adequate time for experimentation with the apparatus.

22879 (JAERI-Tech–94-037) **Development of piezoelectric actuator gas injection valve for JT-60U.** Hiratsuka, Hajime (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Miyo, Yasuhiko; Koike, Tsuneyuki; Shimizu, Masatsugu; Komuro, Ken-ichi. Japan Atomic Energy Research Inst., Tokyo (Japan). Jan 1995. 49p. (In Japanese). Order Number DE95780675. Source: OSTI; NTIS; INIS.

Piezoelectric actuator gas injection valve by lever for JT-60U have been developed using piezoelectric actuator (Laminated piezoelectric elements). Specifications of the valve are summarized as follows: (1) The piezoelectric actuator gas injection valve by lever (LE-PEV) is the same configuration as the low flow rate

piezoelectric valve (PEV-L), (2) The laminated piezoelectric element is used as actuator, (3) The massflow rate is up to 30.7 Pam^3/s for hydrogen, 0.2 MPa back pressure, 150 V, (4) The sheet leak rate using helium as a probing gas is smaller than $1.33x10^{-8}$ Pam^3/s, (5) The operating voltage is 0 - 150 V. Judging from these results performances of LE-PEV for the actual operation condition of JT-60U is good. (author).

22880 (LA-UR–95-1306) **Multimode hydrodynamic stability calculations for National Ignition Facility capsules.** Hoffman, N.M.; Wilson, D.C.; Varnum, W.S.; Krauser, W.J.; Wilde, B.H. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950476–3: 12. international conference on laser interaction and related plasma phenomena, Osaka (Japan), 24-28 Apr 1995). Order Number DE95012073. Source: OSTI; NTIS; INIS; GPO Dep.

The authors examine the hydrodynamic stability of imploding ICF capsules by explicitly calculating, the evolution of a realistic surface perturbation far into its nonlinear regime, using, a 2D Lagrangian radiation-hydrodynamics code. The perturbation, which consists initially of mesh displacements in the capsule, is represented by the sum of many spherical harmonic modes, having finite amplitudes and realistic spectrum. A 90-degree sector of the capsule is modeled, allowing proper boundary conditions for all modes simultaneously. Because of the large distortion of the mesh that occurs during the calculations, it is necessary to rezone the mesh frequently, by mapping physical variables to a new undistorted mesh. No model-specific parameters are required in this technique. The authors have used the technique to calculate the yield of several designs for a National Ignition Facility capsule as a function of initial root-mean-square surface roughness σ of the outer ablator surface or the inner cryogenic DT surface. Typically for a capsule they find a "cliff" at a critical value of $\sigma = \sigma_{crit}$ such that the yield of the capsule decreases abruptly for $\sigma > \sigma_{crit}$, indicating a failure to ignite. The values of σ_{crit} they compute are probably upper limits because of the lack of 3D effects, and inaccuracies in Lagrangian modeling of such unstable flows. It is expected that more accurate modeling, perhaps with 3D Eulerian codes, will lead to smaller values for σ_{crit}. They are beginning to carry out studies of the coupling of low-mode radiation flux asymmetries to higher-mode surface perturbations. They report also on sensitivity studies that examine the response of a capsule to small variations in the driving laser's power history. They find that realistic surfaces decrease a capsule's ability to tolerate drive variations.

22881 (LA-UR–95-1350) **Modeling of drive-symmetry experiments in gas-filled hohlraums at Nova.** Lindman, E.L. (Los Alamos National Lab., NM (United States)); Magelssen, G.R.; Delamater, E.L.; Hauer, A.A.; Wilde, B.H.; Powers, L.V.; Murphy, T.J.; Pollaine, S.M.; Suter, L.J. Los Alamos National Lab., NM (United States); Lawrence Livermore National Lab., CA (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36 ; W-7405-ENG-48. (CONF-950476–2: 12. international conference on laser interaction and related plasma phenomena, Osaka (Japan), 24-28 Apr 1995). Order Number DE95012065. Source: OSTI; NTIS; INIS; GPO Dep.

Experiments on capsule implosions in gas-filled hohlraums have been carried out on the NOVA Laser at Lawrence Livermore National Laboratory. Observed capsule shapes are more oblate than predicted using modeling methods which agree well with experiments in evacuated hohlraums. Improvements in modeling required to calculate these experiments and additional experiments are being pursued.

22882 (NIFS–322) **Recent studies of the large helical device.** Iiyoshi, Atsuo; Yamazaki, Kozo. National Inst. for Fusion Science, Nagoya (Japan). Nov 1994. 15p. Order Number DE95780466. Source: OSTI; NTIS; INIS.

The Large Helical Device (LHD) is presently under construction (1990-1997) in NIFS, Japan. The magnetic configuration is chosen as an optimized heliotron with double helix coils, succeeding Heliotron-E, ATF and CHS. Target plasma parameters of the LHD with fully superconducting coil systems are; $n\tau_E T$-10^{20} $m^{-3}\cdot s\cdot keV$, β-bar=5% and steady operations with R_p=3.75m, a_p=50-65cm and B_0=3-4T. The major objectives of the LHD project are to demonstrate good plasma confinement, high beta achievement and steady-state divertor operation in the helical system. Various R and D results have been obtained on superconducting coils, negative ion source and special diagnostics for LHD. In our new site (Tokicity, Gifu-prefecture), the construction of the main experimental hall of the LHD Building was finished, and the winding of the helical coil has been started there. The construction of LHD will be completed in 1997. (author).

22883 (NIFS–323) **The next large helical devices.** Iiyoshi, Atsuo; Yamazaki, Kozo. National Inst. for Fusion Science, Nagoya (Japan). Nov 1994. 34p. Order Number DE95780467. Source: OSTI; NTIS; INIS.

Helical systems have strong merits of steady-state operations for fusion reactors. Two large helical devices with fully superconducting coil systems are presently under design and construction. One is the LHD (Large Helical Device, major radius = 3.9m, magnetic field = 3-4T, under construction during 1990-1997) in NIFS (National Institute for Fusion Science)-Nagoya/Toki, Japan, which provides with continuous helical coils and clean helical divertor focusing on edge configuration optimization. The other one is the W7-X (Wendelstein 7-X, major radius = 5.5m, magnetic field = 3T, under approval) in MPIPP (Max-Planck Institute for Plasma Physics)-Garching, Germany, which adopted a modular coil system after elaborate optimization studies of core plasma physics. These two programs are complementary to promote world helical fusion research and to extend the comprehensive understanding of toroidal plasmas by comparing with large tokamaks. (author).

22884 (NIFS–324) **Quasisymmetry equations for conventional stellarators.** Pustovitov, V.D. National Inst. for Fusion Science, Nagoya (Japan). Nov 1994. 24p. Order Number DE95780479. Source: OSTI; NTIS; INIS.

General quasisymmetry condition, which demands the independence of B^2 on one of the angular Boozer coordinates, is reduced to two equations containing only geometrical characteristics and helical field of a stellarator. The analysis is performed for conventional stellarators with a planar circular axis using standard stellarator expansion. As a basis, the invariant quasisymmetry condition is used. The quasisymmetry equations for stellarators are obtained from this condition also in an invariant form. Simplified analogs of these equations are given for the case when averaged magnetic surfaces are circular shifted torii. It is shown that quasisymmetry condition can be satisfied, in principle, in a conventional stellarator by a proper choice of two satellite harmonics of the helical field in addition to the main harmonic. Besides, there appears a restriction on the shift of magnetic surfaces. Thus, in general, the problem is closely related with that of self-consistent description of a configuration. (author).

22885 (NIFS–326) **New pellet production and acceleration technologies for high speed pellet injection system 'HIPEL' in large helical device.** Viniar, I. (Saint-Petersburg Technical Univ. (Russian Federation)); Sudo, S. National Inst. for Fusion Science, Nagoya (Japan). Dec 1994. 28p. Order Number DE95780469. Source: OSTI; NTIS; INIS.

New technologies of pellet production and acceleration for fueling and diagnostics purposes in large thermonuclear reactors are proposed. The technologies are intended to apply to the multiple-pellet injection system 'HIPEL' for Large Helical Device of NIFS in Japan. The pellet production technology has already been tested in a pipe-gun type pellet injector. It will realize the repeating pellet injection by means of decreasing of the pellet formation time into the pipe-gun barrel. The acceleration technology is based upon a new pump tube operation in two-stage gas gun and also upon a new conception of the allowable pressure acting on a pellet into a barrel. Some preliminary estimations have been made, and principles of a pump tube construction providing for a reliable long term operation in the repeating mode without any troubles from a piston are proposed. (author).

22886 (UCRL-CR–120302-Pt.1) **Final report Task Order Number B239641 between the Regents of the University of California and Institute of Experimental Physics task 1: Conceptual design. Part 1.** Galakhov, I.V. (Russian Federal Nuclear

Center (Russian Federation)); Kirillov, G.A.; Murugov, V.M. Lawrence Livermore National Lab., CA (United States); Russian Federal Nuclear Center (Russian Federation). Nov 1994. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013270. Source: OSTI; NTIS; INIS; GPO Dep.

The current worldwide developmental status of high power lasers and pumping systems for laser ignition facilities is presented. Design philosophies of pulsed power systems for laser fusion (LF) research facilities are discussed. A conceptual design of the facility pulsed power systems is discussed in detail. In conclusion, a thorough analysis of current worldwide LF research is given.

22887 (UCRL-ID–119916) **Scaling laws for specialized hohlraums.** Rosen, M.D. Lawrence Livermore National Lab., CA (United States). 28 Sep 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013291. Source: OSTI; NTIS; INIS; GPO Dep.

The author presents scaling laws for the behavior of hohlraums that are somewhat more complex than a simple sphere or cylinder. In particular the author considers hohlraums that are in what has become known as a "primary" "secondary" configuration, namely geometries in which the laser is absorbed in a primary region of a hohlraum, and only radiation energy is transported to a secondary part of the hohlraum that is shielded from seeing the laser light directly. Such hohlraums have been in use of late for doing LTE opacity experiments on a sample in the secondary and in recently proposed "shimmed" hohlraums that use gold disks on axis to block a capsule's view of the cold laser entrance hole. The temperature/drive of the secondary, derived herein, scales somewhat differently than the drive in simple hohlraums.

22888 (UCRL-JC–117325) **Preparation of germanium doped plasma polymerized coatings as ICF target ablators.** Brusasco, R.M.; Saculla, M.D.; Cook, R.C. Lawrence Livermore National Lab., CA (United States). 5 Oct 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941001–15: 41. annual American Vacuum Society symposium, Denver, CO (United States), 24-28 Oct 1994). Order Number DE95012470. Source: OSTI; NTIS; INIS; GPO Dep.

Targets for Inertial Confinement Fusion (ICF) experiments at the Lawrence Livermore National Laboratory (LLNL) utilize an organic (CH) ablator coating prepared by plasma polymerization. Some of these experiments require a mid-Z dopant in the ablator coating to modify the opacity of the shell. Bromine had been used in the past, but the surface finish of brominated CH degrades rapidly with time upon exposure to air. This paper describes the preparation and characterization of plasma polymer layers containing germanium as a dopant at concentrations of between 1.25 and 2.25 atom percent. The coatings are stable in air and have an rms surface roughness of 7–9 nm (modes 10–1,000) which is similar to that obtained with undoped coatings. High levels of dopant result in cracking of the inner mandrel during target assembly. Possible explanations for the observed cracking behavior will be discussed.

22889 (UCRL-JC–117397) **The National Ignition Facility Project.** Paisner, J.A.; Campbell, E.M.; Hogan, W.J. Lawrence Livermore National Lab., CA (United States). 16 Jun 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940630–57: 11. topical meeting on the technology of fusion energy, New Orleans, LA (United States), 19-24 Jun 1994). Order Number DE95010923. Source: OSTI; NTIS; INIS; GPO Dep.

The mission of the National Ignition Facility is to achieve ignition and gain in ICF targets in the laboratory. The facility will be used for defense applications such as weapons physics and weapons effect testing, and for civilian applications such as fusion energy development and fundamental studies of matter at high temperatures and densities. This paper reviews the design, schedule and costs associated with the construction project.

22890 (UCRL-JC–117467) **National Ignition Facility environmental protection systems.** Mintz, J.M.; Reitz, T.C.; Tobin, M.T. Lawrence Livermore National Lab., CA (United States). Jun 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940630–56: 11. topical meeting on the technology of fusion energy, New Orleans, LA (United States), 19-24 Jun 1994). Order Number DE95010921. Source: OSTI; NTIS; INIS; GPO Dep.

The conceptual design of Environmental Protection Systems (EPS) for the National Ignition Facility (NIF) is described. These systems encompass tritium and activated debris handling, chamber, debris shield and general decontamination, neutron and gamma monitoring, and radioactive, hazardous and mixed waste handling. Key performance specifications met by EPS designs include limiting the tritium inventory to 300 Ci and total tritium release from NIF facilities to less than 10 Ci/yr. Total radiation doses attributable to NIF shall remain below 10 mrem/yr for any member of the general public and 500 mrem/yr for NIF staff. ALARA-based design features and operational procedures will, in most cases, result in much lower measured exposures. Waste minimization, improved cycle time and reduced exposures all result from the proposed CO2 robotic arm cleaning and decontamination system, while effective tritium control is achieved through a modern system design based on double containment and the proven detritiation technology.

22891 (UCRL-JC–117491) **Multiple-beam pulse shaping and preamplification.** Wilcox, R.B.; VanWonterghem, B.W.; Burkhart, S.C.; Davin, J.M. Lawrence Livermore National Lab., CA (United States). 9 Nov 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9411152–4: International Atomic Energy Agency (IAEA) technical committee meeting on drivers for inertial confinement fusion, Paris (France), 14-18 Nov 1994). Order Number DE95011738. Source: OSTI; NTIS; GPO Dep.

Glass fusion laser systems typically use a master oscillator-power amplifier (MOPA) architecture, where control of the optical pulse temporal and spatial parameters is accomplished mainly in the master oscillator and low power optics. The pulses from this low power "front end" are amplified in the power amplifier, which modifies the pulse shape temporally and spatially. Nonlinear frequency conversion crystals following the amplifier further change the pulse before it reaches the target. To effectively control the optical pulse on target for different types of experiments, and compensate for nonlinearity in the preceding optics, the front end system must be versatile enough to easily control many pulse parameters over a large range. The front end pulse generation system described in this article represents a new approach to this problem. The proposed National Ignition Facility (NIF) has 192 beamlines, each of which requires an input pulse of up to 12 Joules in around 4 ns equivalent square pulse length. Considerations of laser architecture for supplying each of these beamlines from a central oscillator system were crucial in the design of the front end. Previous lasers have used bulk optics to split a single oscillator signal and report beams to multiple amplifier chains. A key idea in the current design is to replace bulk optic transport with fibers, eliminating large opto-mechanical subsystems. Another important concept is convenient pulse forming using low voltage integrated optic modulators. The integrated optic and fiber optic concepts resulted in the current pulse generation designs for NEF. An important advantage is that each of the beamlines can have an independently controlled temporal pulse shape, which provides for precise balance of instantaneous power on target.

22892 (UCRL-JC–119004) **Absolute wavefront measurements of high-energy laser beams in the Beamlet Demonstration Project for the National Ignition Facility.** Salmon, J.T.; Bliss, E.S.; Kartz, M.W.; Van Wonterghem, B.M. Lawrence Livermore National Lab., CA (United States). Nov 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950540–10: 15. conference on lasers and electro-optics and 5th quantum electronics and laser science conference, Baltimore, MD (United States), 21-26 May 1995). Order Number DE95012224. Source: OSTI; NTIS; INIS; GPO Dep.

The authors measure the absolute wavefront of Beamlet output pulses and actively correct for slowly varying aberrations present when the power amplifiers are not fired. Provision is also made for active precompensation of pump-induced amplifier aberrations.

22893 (UCRL-JC–119390) **Fabrication and testing of gas filled targets for large scale plasma experiments on Nova.** Stone, G.F. (Lawrence Livermore National Lab., CA (United

States)); Spragge, M.; Wallace, R.J.; Rivers, C.J. Lawrence Livermore National Lab., CA (United States). 6 Mar 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950291–2: 10. target fabrication specialists' meeting, Taos, NM (United States), 6-9 Feb 1995). Order Number DE95012471. Source: OSTI; NTIS; INIS; GPO Dep.

An experimental campaign on the Nova laser was started in July 1993 to study one st of target conditions for the point design of the National Ignition Facility (NIF). The targets were specified to investigate the current NIF target conditions–a plasma of ~3 keV electron temperature and an electron density of ~1.0 E + 21 cm^{-3}. A gas cell target design was chosen to confine as gas of ~0.01 cm^3 in volume at ~ 1 atmosphere. This paper will describe the major steps and processes necessary in the fabrication, testing and delivery of these targets for shots on the Nova Laser at LLNL.

22894 (UCRL-JC–119533) **Feasibility of organo-beryllium target mandrels using organo-germanium PECVD as a surrogate.** Brusasco, R.M.; Dittrich, T.; Cook, R.C. Lawrence Livermore National Lab., CA (United States). 9 Mar 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950291–1: 10. target fabrication specialists' meeting, Taos, NM (United States), 6-9 Feb 1995). Order Number DE95011802. Source: OSTI; NTIS; INIS; GPO Dep.

Inertial Confinement Fusion capsules incorporating beryllium are becoming attractive for use in implosion experiments designed for modest energy gain. This paper explores the feasibility of chemical vapor deposition of organo-beryllium precursors to form coating materials of interest as ablators and fuel containers. Experiments were performed in a surrogate chemical system utilizing tetramethylgermane as the organometallic precursor. Coatings with up to 60 mole percent germanium were obtained. These coatings compare favorably with those previously reported in the literature and provide increasing confidence that a similar deposition process with an organo-beryllium precursor would be successful.

22895 (UCRL-JC–120517) **Optical pulse generation using fiber lasers and integrated optics.** Wilcox, R.B.; Browning, D.F.; Burkhart, S.C.; VanWonterghem, B.W. Lawrence Livermore National Lab., CA (United States). 27 Mar 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9506179–1: 1995 international conference on integrated optics and optical fibre communications, Tokyo (Japan), 26-30 Jun 1995). Order Number DE95011517. Source: OSTI; NTIS; INIS; GPO Dep.

We have demonstrated an optical pulse forming system using fiber and integrated optics, and have designed a multiple-output system for a proposed fusion laser facility. Our approach is an advancement over previous designs for fusion lasers, and an unusual application of fiber lasers and integrated optics.

22896 (UCRL-LR–105821-94-3) **Inertial confinement fusion quarterly report, April–June 1994. Volume 4, Number 3.** Shaw, M.J. (ed.). Lawrence Livermore National Lab., CA (United States). Jun 1994. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011970. Source: OSTI; NTIS; GPO Dep.

This issue of the ICF Quarterly contains six articles covering a wide range of activities within the Inertial Confinement Fusion (ICF) Program. It concentrates on target design; theoretical spectral analysis of ICF capsule surfaces; laser fusion experimental methods; and an alternative ICF design, based on ultrafast, ultrapowerful lasers. A key issue for the success of the ICF process is the hydrodynamic stability of the imploding capsule. There are two primary sources of instability growth in the ICF process: (1) asymmetries in the x-ray flux that drive the compression lead to asymmetric in the imploding surface; (2) imperfections on the capsule surface can grow into large perturbations, degrading the capsule performance. In recent years, a great deal of effort, both experimentally and theoretically, has been spent to enhance the Program's ability to measure, model, and minimize instability growth during an implosion. Four the articles in this issue discuss this subject.

22897 (UCRL-LR–105821-94-4) **Inertial confinement fusion quarterly report, July–September 1994. Volume 4, Number 4.** Honea, E. (ed.). Lawrence Livermore National Lab., CA (United States). Sep 1994. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011969. Source: OSTI; NTIS; GPO Dep.

The ICF Quarterly continues with six articles in this issue describing recent developments in the Inertial Confinement Fusion (ICF) Program at Lawrence Livermore National Laboratory. The topics include plasma characterization, production of millimeter scale-length plasmas for studying laser-plasma instabilities, hohlraum physics, three-dimensional hydrodynamic modeling, crystal growth, and laser-beam smoothing.

99 GENERAL AND MISCELLANEOUS

22898 (UCRL-ID–119305) **The metric system: An introduction.** Lumley, S.M. Lawrence Livermore National Lab., CA (United States). [1995]. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012107. Source: OSTI; NTIS; GPO Dep.

On July 13, 1992, Deputy Director Duane Sewell restated the Laboratory's policy on conversion to the metric system which was established in 1974. Sewell's memo announced the Laboratory's intention to continue metric conversion on a reasonable and cost effective basis. Copies of the 1974 and 1992 Administrative Memos are contained in the Appendix. There are three primary reasons behind the Laboratory's conversion to the metric system. First, Public Law 100-418, passed in 1988, states that by the end of fiscal year 1992 the Federal Government must begin using metric units in grants, procurements, and other business transactions. Second, on July 25, 1991, President George Bush signed Executive Order 12770 which urged Federal agencies to expedite conversion to metric units. Third, the contract between the University of California and the Department of Energy calls for the Laboratory to convert to the metric system. Thus, conversion to the metric system is a legal requirement and a contractual mandate with the University of California. Public Law 100-418 and Executive Order 12770 are discussed in more detail later in this section, but first they examine the reasons behind the nation's conversion to the metric system. The second part of this report is on applying the metric system.

22899 (ANL/CMT-ACL/CP–85835) **Development of the Integrated Performance Evaluation Program (IPEP) for the Department of Energy's Office of Environmental Management.** Lindahl, P. (Argonne National Lab., IL (United States)); Streets, E.; Bass, D.; Hensley, J.; Newberry, R.; Carter, M. Argonne National Lab., IL (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950495–2: 7. national technology information exchange workshop, Cincinnati, OH (United States), 18-20 Apr 1995). Order Number DE95012929. Source: OSTI; NTIS; INIS; GPO Dep.

Argonne National Laboratory (ANL) and DOE's Radiological and Environmental Sciences Laboratory (RESL), Environmental Measurements Laboratory (EML), and Grand Junction Project office (GJPO) are collaborating with DOE's Office of Environmental Management (EM), Analytical Services Division (ASD, EM-263) and the Environmental Protection Agency (EPA) to develop an Integrated Performance Evaluation Program (IPEP). The purpose of the IPEP is to integrate information from existing PE programs with expanded QA activities to develop information about the quality of radiological, mixed waste, and hazardous environmental sample analyses provided by all laboratories supporting EM programs. The IPEP plans to utilize existing PE programs when available and appropriate for use by DOE; new PE programs will be developed only when no existing program meets DOEs needs. Interagency Agreements have been developed between EPA and DOE to allow DOE to use major existing PE programs developed by EPA. In addition, the DOE radiological Quality Assessment Program (QAP) administered by EML is being expanded for use in EM work. RESL and GJPO

are also developing the Mixed Waste Performance Evaluation Program (MAPEP) to provide radiological, inorganic, and organic analytes of interest to EM programs. The use of information from multiple PE programs will allow a more global assessment of an individual laboratory's performance, as well as providing a means of more fairly comparing laboratories' performances in a given analytical area. The EPEP will interact with other aspects of the ASD such as audit and methods development activities to provide an integrated system for assessment and improvement of data quality.

22900 (ANL/DIS/CP–84623) **Strategies for reconciling environmental goals, productivity improvement, and increased energy efficiency in the industrial sector: Analytic framework.** Boyd, G.A. Argonne National Lab., IL (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950223–2: 3. biennial energy efficiency and the global environment conference: industrial competitiveness and sustainability, Newport Beach, CA (United States), 8-9 Feb 1995). Order Number DE95012937. Source: OSTI; NTIS; GPO Dep.

The project is motivated by recommendations that were made by industry in a number of different forums: the Industry Workshop of the White House Conference on Climate Change, and more recently, industry consultations for EPAct Section 131(c) and Section 160(b). These recommendations were related to reconciling conflicts in environmental goals, productivity improvements and increased energy efficiency in the industrial sector.

22901 (ANL/EA/CP–85661) **Determining training needs from supervisors' assessment of staff proficiency in tasks and skills.** Young, C. (Argonne National Lab., IL (United States)); Hensley, J.; Lehr, J. Argonne National Lab., IL (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950216–144: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95012934. Source: OSTI; NTIS; GPO Dep.

To provide the basis for establishing training opportunities, this project investigated supervisors' views of three components of staff activities. The project established the tasks that staff perform, identified staffs level of effectiveness in performing these tasks, and investigated staffs level of proficiency in performing the skills underlying these tasks. Training opportunities were then determined in those areas where knowledge and skins could be improved for staff to perform their tasks more effectively. Staff currently perform their tasks sufficiently well. Furthermore, supervisors indicated that for the most part staff do perform the tasks they should perform. In carrying out these tasks, staff use primarily critical thinking, problem solving, and communication skills rather than discipline-specific skills. Although staff generally have working knowledge of most of these skills, additional training in critical thinking and problem solving, program and project management techniques, and communications is appropriate to further improve the organizations effectiveness.

22902 (CEA-SFID–2.b) **Memento on the period of instruction reception of safety engineers 1995.** Faure, J.; Maggioli, P. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Section Formation Informatique Documentation. Jan 1995. 144p. (In French). Order Number DE95632492. Source: OSTI; NTIS (US Sales Only); INIS.

In this report on the instruction period for safety engineers are given the calendar for 1995, a brief curriculum vitae of the interveners and the leading ideas of their presentation.

22903 (CONF-950669–2) **Managing electronic records: A guideline.** Stewart, J. Oak Ridge National Lab., TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From DOE records management conference: El Camino Real to the year 2000; Albuquerque, NM (United States); 27-30 Jun 1995. Order Number DE95013973. Source: OSTI; NTIS; GPO Dep.

A committee at Martin Marietta Energy Systems (MMES) has drafted a guideline to assist offices in the management of electronic records. This paper will address the activities surrounding its creating. The guideline is for use by creators, users, and custodians of any type of electronic information. The guideline supports and supplements requirements from DOE and the National Archives and Records Administration (NARA), other internal processes such as system reviews, and the comprehensive records management program. While an in-house publication, it could prove useful to other organizations implementing an electronic records management program.

22904 (DOE/EM–0239) **Cost quality management assessment for the Savannah River Site. Final report.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of Engineering and Cost Management. Jun 1995. 130p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014141. Source: OSTI; NTIS; INIS; GPO Dep.

The Office of Engineering and Cost Management (EM-24) conducted the Round I Cost Quality Management Assessment at the Savannah River Operations Office on Feb. 3-14, 1992. Since the Round I CQMA, the mission of DOE-SR changed from production of nuclear materials (T_2, Pu) to environmental restoration. Transition of DOE-SR from defense programs to environmental management started in Jan. 1995. The Round II CQMA at the Savannah River Site, conducted April 23-May 5, 1995, reviewed DOE-SR's cost and cost-related management practices against performance objectives and criteria. SRS has made progress in cost-management practices since Round I and is adopting a more cost-conscious culture.

22905 (FEMP–2425) **The Fernald wet records recovery project: A case history.** Sterling, H.J. (Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States)); Devir, B.R.; Hawley, R.A.; Freesmeyer, M.T. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). 7 Jun 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950669–1: DOE records management conference: El Camino Real to the year 2000, Albuquerque, NM (United States), 27-30 Jun 1995). Order Number DE95013795. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses a project performed to recover wet records discovered in January 1995 at the Fernald Environmental Management Project (FEMP). This paper discusses the emergency and record recovery phases of the project, the technical options considered for records recovery, and special measures which were required due to radiological contamination of the records. Also, the root causes and lessons learned from the incident, and path forward for future records management operations at Fernald, are discussed.

22906 (SAND–89-0217-Rev.5) **Acronyms, initialisms and abbreviations. Revision 5.** Tolman, B.J. (comp.). Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 167p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010679. Source: OSTI; NTIS; GPO Dep.

This document is a list of utilized acronyms, initialisms, and abbreviations frequently utilized, or derived from, personnel, particularly scientific personnel and engineers, working on government contracts or as government employees.

22907 (UCRL-ID–120595) **Advanced manufacturing: Technology and international competitiveness.** Tesar, A. Lawrence Livermore National Lab., CA (United States). Feb 1995. 172p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95014508. Source: OSTI; NTIS; GPO Dep.

Dramatic changes in the competitiveness of German and Japanese manufacturing have been most evident since 1988. All three countries are now facing similar challenges, and these challenges are clearly observed in human capital issues. Our comparison of human capital issues in German, Japanese, and US manufacturing leads us to the following key judgments: Manufacturing workforces are undergoing significant changes due to advanced manufacturing technologies. As companies are forced to develop and apply these technologies, the constituency of the manufacturing workforce (especially educational requirements, contingent labor, job content, and continuing knowledge development) is being dramatically and irreversibly altered. The new workforce requirements which result

due to advanced manufacturing require a higher level of worker sophistication and responsibility.

22908 (ANL/ECT/CP–85500) **Kerberos authentication: The security answer for unsecured networks.** Engert, D.E. Argonne National Lab., IL (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9505223–1: 17. DOE Computer Security Group training conference, Germantown, MD (United States), 8-11 May 1995). Order Number DE95013434. Source: OSTI; NTIS; GPO Dep.

Traditional authentication schemes do not properly address the problems encountered with today's unsecured networks. Kerbmm developed by MIT, on the other hand is designed to operate in an open unsecured network, yet provide good authentication and security including encrypted session traffic. Basic Kerberos principles as well as experiences of the ESnet Authentication Pilot Project with Cross Realm. Authentication between four National Laboratories will also be described.

22909 (ANL/MCS/CP–83746) **A data transfer library for communicating data-parallel tasks.** Avalani, B. (CIS/CSE, Syracuse Univ., Syracuse, NY (United States)); Choudhary, A.; Krishnaiyer, R.; Foster, I.; Xu, M. Argonne National Lab., IL (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Contract CCR-8809615; Contract DABT63-91-C-0028; Award CCR-93578 (CONF-9502101–1: Frontiers 95: a workshop on future directions of massively parallel processing, McLean, VA (United States), 6-9 Feb 1995). Order Number DE95012288. Source: OSTI; NTIS; GPO Dep.

Many computations can be structured as sets of communicating data-parallel tasks. Individual tasks may be coded in HPF, pcC+, etc.; periodically, tasks exchange distributed arrays via channel, virtual file, message-passing, etc., operations. The implementation of these operations is complicated by the fact that the processes engaging in the communication may execute on different numbers of processors and may have different distributions for communicated data structures. In addition, they may be connected by different sorts of networks. In this paper, we describe a Communicating Data-parallel Tasks (CDT) library that we are developing for constructing applications of this sort. We outline the techniques used to implement this library and describe a range of data transfer strategies and several algorithms based on these strategies. We also present performance results for several algorithms. The CDT library is being used as a compiler target for an HPF compiler augmented with FM extensions.

22910 (ANL/MCS/CP–84608) **On the influence of the partitioning schemes on the efficiency of overlapping domain decomposition methods.** Ciarlet, P. Jr. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)); Lamour, F.; Smith, B.F. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-31-109-ENG-38. NSF Contract ASC9201266; Army Research Office Contract DAAL0391G (CONF-9502101–3: Frontiers 95: a workshop on future directions of massively parallel processing, McLean, VA (United States), 6-9 Feb 1995). Order Number DE95012935. Source: OSTI; NTIS; GPO Dep.

One level overlapping Schwarz domain decomposition preconditioners can be viewed as a generalization of block Jacobi preconditioning. The effect of the number of blocks and the amount of overlapping between blocks on the convergence rate is well understood. This paper considers the related issue of the effect of the scheme used to partition the matrix into blocks on the convergence rate of the preconditioned iterative method. Numerical results for Laplace and linear elasticity problems in two and three dimensions are presented. The tentative conclusion is that using overlap tends to decrease the differences between the rates of convergence for different partitioning schemes.

22911 (ANL/MCS/CP–86364) **On the automatic differentiation of computer programs.** Bischof, C.H. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-31109-ENG-38. Cooperative Agreement CCR-9120008; Purchase Order L25935D. (CONF-950317–1: Symposium on optimization of mechanical systems, Stuttgart (Germany), 26-31 Mar 1995). Order Number DE95012276. Source: OSTI; NTIS; GPO Dep.

Automatic differentiation (AD) is a methodology for developing sensitivity-enhanced versions of arbitrary computer programs. In this paper, we provide some background information on AD and address some frequently asked questions. We introduce the ADIFOR and ADIC tools for the automatic differentiation of Fortran 77 and ANSI-C programs, respectively, and give an example of applying ADIFOR in the context of the optimization of multibody systems.

22912 (ANL/MCS/CP–86474) **Scalable Unix tools on parallel processors.** Gropp, W.; Lusk, E. Argonne National Lab., IL (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9405100–13: Scalable high performance computing conference, Knoxville, TN (United States), 23 May 1994). Order Number DE95012292. Source: OSTI; NTIS; GPO Dep.

The introduction of parallel processors that run a separate copy of Unix on each process has introduced new problems in managing the user's environment. This paper discusses some generalizations of common Unix commands for managing files (e.g. ls) and processes (e.g. ps) that are convenient and scalable. These basic tools, just like their Unix counterparts, are text-based. We also discuss a way to use these with a graphical user interface (GUI). Some notes on the implementation are provided. Prototypes of these commands are publicly available.

22913 (ANL/MCS-TM–150-Rev.) **The MINPACK-2 test problem collection.** Averick, B.M. (Minnesota Univ., Minneapolis, MN (United States). Army High Performance Computing Research Center); Carter, R.G.; Xue, Guo-Liang; More, J.J. Argonne National Lab., IL (United States). Jun 1992. 69p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95013766. Source: OSTI; NTIS; GPO Dep.

Optimization software has often been developed without any specific application in mind. This generic approach has worked well in many cases, but as we seek the solution of larger and more complex optimization problems on high-performance computers, the development of optimization software should take into account specific optimization problems that arise in a wide range of applications. This observation was the motivation for the development of the MINPACK-2 test problem collection. Each of the problems in this collection comes from a real application and is representative of other commonly encountered problems. There are problems from such diverse fields as fluid dynamics, medicine, elasticity, combustion, molecular conformation, nondestructive testing, chemical kinetics, lubrication, and superconductivity.

22914 (ANL/MCS/TM–201) **Users guide to the Argonne SP scheduling system.** Lifka, D.A. (Argonne National Lab., IL (United States)); Henderson, M.W.; Rayl, K. Argonne National Lab., IL (United States). May 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95012987. Source: OSTI; NTIS; GPO Dep.

During the past five years scientists discovered that modern UNIX workstations connected with ethernet and fiber networks could provide enough computational performance to compete with the supercomputers of the day. As this concept became increasingly popular, the need for distributed queuing and scheduling systems became apparent. Today, supercomputers, such as Argonne National Laboratory's IBM SP system, can provide more CPU and networking speed than can be obtained from these networks of workstations. These modern supercomputers look like clusters of workstations, however, so developers felt that the scheduling systems that were previously used on clusters of workstations should still apply. After trying to apply some of these scheduling systems to Argonne's SP environment, it became obvious that these two computer environments have very different scheduling needs. Recognizing this need and realizing that no one has addressed it, we developed a new scheduling system. The approach taken in creating this system was unique in that user input and interaction were encouraged throughout the development process. Thus, a scheduler was built that actually worked the way the users wanted it to work. This document serves a dual purpose. It is both a user's guide and an administrator's guide for the ANL SP scheduling system. Look for revisions to this guide that will be appearing.

22915 (ANL/MCS/TM–206) **Users manual for doctext: Producing documentation from C source code.** Gropp, W. Argonne National Lab., IL (United States). Mar 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95012943. Source: OSTI; NTIS; GPO Dep.

One of the major problems that software library writers face, particularly in a research environment, is the generation of documentation. Producing good, professional-quality documentation is tedious and time consuming. Often, no documentation is produced. For many users, however, much of the need for documentation may be satisfied by a brief description of the purpose and use of the routines and their arguments. Even for more complete, hand-generated documentation, this information provides a convenient starting point. We describe here a tool that may be used to generate documentation about programs written in the C language. It uses a structured comment convention that preserves the original C source code and does not require any additional files. The markup language is designed to be an almost invisible structured comment in the C source code, retaining readability in the original source. Documentation in a form suitable for the Unix man program (nroff), LaTeX, and the World Wide Web can be produced.

22916 (BNL–61505) **Summer Research Internship Program (FY94) Brookhaven National Laboratory.** Toler, L.T.; Indusi, J.P. Brookhaven National Lab., Upton, NY (United States). 1 Feb 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9502100–1: Workshop on the Summer Research Intership Program, Newport News, VA (United States), 16-17 Feb 1995). Order Number DE95008868. Source: OSTI; NTIS; GPO Dep.

The Summer Research Internship Program is a new program that allows high school teachers to participate and assist scientific staff at national laboratories in specific research assignments. This participation allows the high school teachers to become familiar with new technology and have "hands-on" experience with experiments and equipment which utilize both mathematics and science skills. Teachers also have the opportunity to advance their new and well-developed software. This enlightenment and experience is brought back into their schools and classrooms in the hopes that their peers and students will realize the excitement that knowledge and education in the areas of mathematics and science can bring. The Safeguards, Safety and Nonproliferation Division of the Department of Advanced Technology at Brookhaven National Laboratory utilized five high school teachers during FY94 in various projects. The project assignments and internship activities are outlined in this paper.

22917 (CEA-CONF–11774) **How many collisions for a neutron in a Tripoli non analogue simulation?.** Morillon, B.; Both, J.P.; Derriennic, H.; Diop, C.M.; Nimal, J.C. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie. 1994. 7p. (CONF-940424–: 8. international conference on radiation shielding, Arlington, TX (United States), 24-27 Apr 1994). Order Number DE95632488. Source: OSTI; NTIS (US Sales Only); INIS.

In an analogue simulation, flux, current, etc. are estimated, and for each particle, the number of shocks is counted and the distance covered is calculated. When the attenuation is significant the natural simulation remains inefficient: it becomes necessary to use variance reduction methods in which the solution of the adjoint transport equation is essential; this is the non analogue simulation. This study analyzes the average behaviour during analogue and non analogue simulations for one-energy group, one dimension transport problem with isotropic shocks. Comparisons between these simulations give hints about why an optimal simulation exists. The penetration problem and the results of the analogue simulation are first presented; then the non analogue simulations are run with path stretching and angular biasing of the scattering kernel, the most important biasing techniques of the Monte Carlo transport TRIPOLI code. (from authors) 11 figs., 3 tabs., 3 refs.

22918 (CEA-CONF–11826) **A finite volume element method for the Navier-Stokes equations.** Emonot, Ph. (CEA Centre d'Etudes de Grenoble, 38 (France). Dept. de Thermohydraulique et de Physique); Villand, M.; Baranger, J.; Maitre, J.F.; Bourg, A. CEA Centre d'Etudes de Grenoble, 38 (France). Dept. de Thermohydraulique et de Physique. 1993. 8p. (CONF-9309333–: 5. international symposium on refined flow modelling and turbulence measurements, Paris (France), 7-10 Sep 1993). Order Number DE95631666. Source: OSTI; NTIS (US Sales Only); INIS.

Finite volume elements methods are introduced with application to the Poisson's equation and the Stokes problem; errors are estimated and theorems are derived. Then the method is applied to the Crouzeix Raviart element and extended in order to solve the full Navier-Stokes equation. Numerical results on the Vahl Davis test case are given. 5 figs., 1 tab., 8 refs.

22919 (CEA-CONF–11843) **The adjoint sensitivity method, a contribution to the code uncertainty evaluation.** Ounsy, A.; Crecy, F. de; Brun, B. CEA Centre d'Etudes de Grenoble, 38 (France). Dept. de Thermohydraulique et de Physique. 1993. 7p. (CONF-930621–: American Society of Mechanical Engineers (ASME) fluids engineering conference, Washington, DC (United States), 20-24 Jun 1993). Order Number DE95631675. Source: OSTI; NTIS (US Sales Only); INIS.

The application of the ASM (Adjoint Sensitivity Method) to thermohydraulic codes, is examined. The advantage of the method is to be very few CPU time consuming in comparison with usual approach requiring one complete code run per sensitivity determination. The mathematical aspects of the problem are first described, and the applicability of the method of the functional-type response of a thermalhydraulic model is demonstrated. On a simple example of non linear hyperbolic equation (Burgers equation) the problem has been analyzed. It is shown that the formalism used in the literature treating this subject is not appropriate. A new mathematical formalism circumventing the problem is proposed. For the discretized form of the problem, two methods are possible: the Continuous ASM and the Discrete ASM. The equivalence of both methods is demonstrated; nevertheless only the DASM constitutes a practical solution for thermalhydraulic codes. The application of the DASM to the thermalhydraulic safety code CATHARE is then presented for two examples. They demonstrate that ASM constitutes an efficient tool for the analysis of code sensitivity. (authors) 7 figs., 5 tabs., 8 refs.

22920 (CONF-930014–1) **An object oriented design for high performance linear algebra on distributed memory architectures.** Dongarra, J.J. (Oak Ridge National Lab., TN (United States)); Walker, D.W.; Pozo, R. Oak Ridge National Lab., TN (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Contract DAAL03-91-C-0047. From 1993 objected-oriented numerics conference; Snowbird, CO (United States); 1993. Order Number DE95012887. Source: OSTI; NTIS; GPO Dep.

We describe the design of ScaLAPACK++, an object oriented C++ library for implementing linear algebra computations on distributed memory multicomputers. This package, when complete, will support distributed dense, banded, sparse matrix operations for symmetric, positive-definite, and non-symmetric cases. In ScaLAPACK++ we have employed object oriented design methods to enchance scalability, portability, flexibility, and ease-of-use. We illustrate some of these points by describing the implementation of a right-looking LU factorization for dense systems in ScaLAPACK++.

22921 (CONF-930331–16) **LAPACK for distributed memory architectures: The next generation.** Demmel, J. (California Univ., Berkeley, CA (United States). Computer Science Div.); Dongarra, J.; van de Geijn, R.; Walker, D. Oak Ridge National Lab., TN (United States). 23 Jan 1995. 7p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC05-84OR21400. Agreement CCR-8809615. From 6. Society for Industrial and Applied Mathematics (SIAM) conference on parallel processing for scientific computing; Norfolk, VA (United States); 21-24 Mar 1993. Order Number DE95012867. Source: OSTI; NTIS; GPO Dep.

We report the progress of an ongoing project that investigates the reusability of LAPACK code for distributed memory MIMD architectures. Major recent revisions include the adoption of a two-dimensional data mapping. This change enhances performance, scalability, and flexibility of the algorithms. Performance results from the Intel iPSC/860 and Intel Touchstone Delta systems are included.

22922 (CONF-9307220–1) **Modeling, mesh generation and adaptive numerical methods for partial differential equations: IMA summer program. Final report, April 1, 1993–March 31, 1994.** Friedman, A.; Miller, W. Jr. Minnesota Univ., Minneapolis, MN (United States). Inst. for Mathematics and Its Applications. [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-93ER25156. From Modeling, mesh generation and adaptive numerical methods for partial differential equations program; Minneapolis, MN (United States); 6-23 Jul 1993. Order Number DE95011540. Source: OSTI; NTIS; GPO Dep.

The program was divided into segments: (Week 1) geometric modeling and mesh generation (Weeks 2 and 3) error estimation and adaptive strategies. Participants in the program came from a wide variety of disciplines dealing with remarkably analogous problems in this area. Ideas were exchanged and interdisciplinary collaboration was initiated in informal contexts as well as in the talks and question periods. In the talks, a number of algorithms were described along with specific applications to problems of great current interest in various scientific and engineering disciplines. In this emerging field, participants developed criteria for evaluation of algorithms and established guidelines for selection of algorithms appropriate to any specific problem. Special features of a problem may include curved surfaces, complicated boundaries, evolving interfaces (such as occur in coating flows), and/or criticality of error estimation.

22923 (CONF-940451–2) **The design of scalable software libraries for distributed memory concurrent computers.** Choi, J. (Oak Ridge National Lab., TN (United States). Mathematical Sciences Section); Walker, D.W.; Dongarra, J.J. Oak Ridge National Lab., TN (United States). [1994]. 9p. Sponsored by Department of Defense, Washington, DC (United States);USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Contract DAAL03-91-C-0047. From Parallel processing symposium; Cancun (Mexico); 26-29 Apr 1994. Order Number DE95012891. Source: OSTI; NTIS; GPO Dep.

This paper describes the design of ScaLAPACK, a scalable software library for performing dense and banded linear algebra computations on distributed memory concurrent computers. The specification of the data distribution has important consequences for interprocessor communication and load balance, and hence is a major factor in determining performance and scalability of the library routines. The block cyclic data distribution is adopted as a simple, yet general-purpose, way of decomposing block-partitioned matrices. Distributed memory versions of the Level 3 BLAS provide an easy and convenient way of implementing the ScaLAPACK routines.

22924 (CONF-9405100–14) **PB-BLAS: A set of parallel block basic linear algebra subprograms.** Choi, Jaeyoung (Tennessee Univ., Knoxville, TN (United States). Dept. of Computer Science); Dongarra, J.; Walker, D.W. Oak Ridge National Lab., TN (United States). [1994]. 31p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. DAAL03-91-C-0047. From Scalable high performance computing conference; Knoxville, TN (United States); 23 May 1994. Order Number DE95012872. Source: OSTI; NTIS; GPO Dep.

We propose a new library of routines for performing dense linear algebra computations on block-partitioned matrices. The routines are referred to as the Block Basic Linear Algebra Subprograms, and their use is restricted to computations in which one or more of the matrices involved consists of a single row or column of blocks, and in which no more than one of the matrices consists of an unrestricted two-dimensional array of blocks. The functionality of the block BLAS routines can also be provided by Level 2 and 3 BLAS routines. However, for Non-Uniform Memory Access machines the use of the block BLAS permit certain optimizations in memory access to be taken advantage of. This is particularly true for distributed memory machines, for which the block BLAS are referred to as the Parallel Block Basic Linear Algebra Subprograms (PB-BLAS). The PB-BLAS are the main focus of this paper, and for a block-cyclic data distribution, a single row or column of blocks lies in a single row or column of the processor template. The PB-BLAS consist of calls to the sequential BLAS for local computations, and calls to the BLACS for communication. The PB-BLAS are the building blocks for implementing ScaLAPACK, the distributed-memory version of LAPACK, and provide the same ease-of-use and portability for ScaLAPACK that the BLAS provide for LAPACK. The PB-BLAS consists of all nine Level 3 BLAS routines, four of the Level-2 BLAS routines, and 2 auxiliary transpose routines. The PB-BLAS are currently available for all numeric data types, i.e., single and double precision real and complex.

22925 (CONF-9409351–1) **QMR methods in computational fluid dynamics.** Nachtigal, N.M.; Semeraro, B.D. Oak Ridge National Lab., TN (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International workshop on solution techniques for large-scale computational fluid dynamics (CFD) problems; Montreal (Canada); 26-28 Sep 1994. Order Number DE95012889. Source: OSTI; NTIS; GPO Dep.

We examine the application of QMR methods to the solution of linear systems of equations arising from the use of implicit solution methods in computational fluid dynamics. We will deal with implicit finite difference schemes for solving the Euler equations. These schemes may arise from the implicit treatment of the time dependent equations or from the use of Newton's method for the solution of the steady state equations. In both situations it is necessary to solve a large sparse nonsymmetric linear system of equations at each iteration. We will examine the effectiveness of QMR in the solution of these systems. W e compare the resulting methods to methods which rely on some other simplifying technique to solve the linear systems. Our goal is to show that the QMR method is a viable alternative to the more ad-hoc schemes for solving implicit computational fluid dynamics problems.

22926 (CONF-9505195–4) **Assurances associated with Monte Carlo code results.** Hollenbach, D.F.; Petrie, L.M. Oak Ridge National Lab., TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Nuclear criticality technology and safety project (NCTSP) annual meeting; San Diego, CA (United States); 17 May 1995. Order Number DE95013218. Source: OSTI; NTIS; GPO Dep.

All Monte Carlo computer codes have an uncertainty associated with the final result. This uncertainty (or standard deviation) is due to the sampling method inherent within the Monte Carlo technique. The basic assumptions required for the final result and uncertainty to be valid are (1) the random numbers used are truly random, (2) there is no correlation between histories, (3) the number of histories used is sufficient to represent the problem, and (4) the entire problem is adequately sampled. The first two assumptions are an integral are strongly dependent on how a problem is set up and the

number of histories processed. These are items the user has direct control over. This paper examines six aspects of the KENO Monte Carlo code that affect the above-mentioned four assumptions.

22927 (DOE/ER/53266–50) **An object-oriented decomposition of the adaptive-hp finite element method.** Wiley, J.C. Texas Univ., Austin, TX (United States). Fusion Research Center. 13 Dec 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER53266. (FRCR–454; CONF-9404121–4: 2. Conference on object-oriented numerics (OONSKI '94), Sun River, OR (United States), 24 Apr 1994). Order Number DE95012142. Source: OSTI; NTIS; GPO Dep.

Adaptive-hp methods are those which use a refinement control strategy driven by a local error estimate to locally modify the element size, h, and polynomial order, p. The result is an unstructured mesh in which each node may be associated with a different polynomial order and which generally require complex data structures to implement. Object-oriented design strategies and languages which support them, e.g., C++, help control the complexity of these methods. Here an overview of the major classes and class structure of an adaptive-hp finite element code is described. The essential finite element structure is described in terms of four areas of computation each with its own dynamic characteristics. Implications of converting the code for a distributed-memory parallel environment are also discussed.

22928 (ESTSC–000734MLTPL01) **SPI/U3.2. Security Profile Inspector for UNIX Systems.** Bartoletti, A. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). 1 Aug 1994. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. Source: ESTSC.

Description: MLT-PLTFM; UNIX; Standard C (95%), Bourne Shell Script (5%); 1 Mag Tape. For security reasons, many data paths are fixed in the code during the installation (compiling) process. Therefore, SPI must be separately installed on each platform on which it is to be run. SPI output reports and cdt database archives may accumulate. These files should be purged manually as appropriate to the need and available disk space.

SPI/U3.2 consists of five tools used to assess and report the security posture of computers running the UNIX operating system. The tools are: Access Control Test: A rule-based system which identifies sequential dependencies in UNIX access controls. Binary Authentication Tool: Evaluates the release status of system binaries by comparing a crypto-checksum to provide table entries. Change Detection Tool: Maintains and applies a snapshot of critical system files and attributes for purposes of change detection. Configuration Query Language: Accepts CQL-based scripts (provided) to evaluate queries over the status of system files, configuration of services and many other elements of UNIX system security. Password Security Inspector: Tests for weak or aged passwords. The tools are packaged with a forms-based user interface providing on-line context-sensistive help, job scheduling, parameter management and output report management utilities. Tools may be run independent of the UI.

22929 (ESTSC–000788MLTPL00) **DYNAMO. Molecular Dynamics and Energy Minimization Based on Embedded Atom Method.** Folies, S.M. (Sandia National Labs., Livermore, CA (United States)); Daw, M.S. Sandia Labs., Livermore, CA (United States). 1 Feb 1992. Sponsored by USDOE, Washington, DC (United States). Source: ESTSC.

Description: MLT-PLTFM; Version provided was compiled an-FORTRAN 77 with Namelist input extensions.; 1 QIC Cartridge. No additional software libraries are required.

This program performs atomic scale computer simulations of the structure and dynamics of metallic system using energetices based on the Embedded Atom Method. The program performs two types of calculations. First, it performs local energy minimization of all atomic positions to determine ground state and saddle point energies and structures. Second, it performs molecular dynamics simulations to determine thermodynamics or miscroscopic dynamics of the system. In both cases, various constraints can be applied to the system. The volume of the system can be varied automatically to achieve any desired external pressure. The temperature in molecular dynamics simulations can be controlled by a variety of methods. Further, the temperature control can be applied either to the entire system or just a subset of the atoms that would act as a thermal source/sink. The motion of one or more of the atoms can be constrained to either simulate the effects of bulk boundary conditions or to facilitate the determination of saddle point configurations. The simulations are performed with periodic boundary conditions.

22930 (ESTSC–000814X309000) **XDELAY. FPGA ROM Code for Very Large FIFO Control.** Pratt, T.J. (Sandia National Labs., Albuquerque, NM (United States)). Sandia National Labs., Albuquerque, NM (United States). 1 Jan 1994. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Source: ESTSC.

Description: XILINX 3090; The program was produced using DMCS86 ROM code and XILINX's configuration language.; 1 QIC Cartridge. .drw=drawing page, .xnf=Xilinx Netlist file, .dly=Internal delay, .cst=Pin constants, .bit=Configuration File, .mcs=Prom file.

The code is used to program a Field Programmable Gate Array (FPGA) controls a 4 megabit FIFO so that a set delay from input to output is maintained. The FPGA is also capable of inserting errors into the data flow in a controlled manner.

22931 (ESTSC–000815SPARC00) **FASTHELP. Integrated Circuit Failure Analysis Hypertext Help System.** Henderson, C. (Sandia National Labs., Albuquerque, NM (United States)); Barton, D.; Campbell, A.; Cole, E.; Mikawa, R.E.; Peterson, K.A.; Rife, J.L.; Soden, J.M. Sandia National Labs., Albuquerque, NM (United States). 30 Sep 1994. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Source: ESTSC.

Description: SUN SPARC; SUN OS 4.1.3, Solaris2.X; Hypertext Markup Language (HTML); 1 Mag Tape. In order to run this package, the user will need an HTML browser (e.g. Mosaic, Netscape, etc.). The user will also need an image viewer such as xv and a movie player such as mpeg play.

This software assists a failure analyst performing failure analysis on integrated circuits. The software can also be used to train inexperienced failure analysts. The software also provides a method for storing information and making it easily available to experienced failure analysts.

22932 (ESTSC–000823MLTPL00) **PGP SOLVER. Solver for Power and Ground Plane Parasitic Inductance Mesh.** Aranha, M. (Lawrence Berkely National Labs., CA (United States)); Royer, S. Lawrence Berkeley Lab., CA (United States). 1 Feb 1995. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Source: ESTSC.

Description: MLT-PLTFM; PGP-Solver can be run on any UNIC; 1 3.5 Diskette.

Printed Circuit Boards, Multichip Modules and other such electronic assemblies typically have two or more conductive interconnect layers or planes separated by some dielectric medium for the purpose of routing connections to power and ground pins respectively. The electrical parasitics, inherent in and between the planes, can be significant. To model these effects, the planes can be represented by a complex mesh of coupled inductive and resistive elements. This allows one to calculate the complex impedence of these parasitic elements so that power and ground pins and associated routing could be optimally positioned. OEA International Inc. has developed software which by spatial analysis using finite-differences techniques produces a large netlist of these parasitic elements. Traditional circuit analysis tools such as SPICE circuit simulators are prohibitively slow in analyzing the netlist. PGP-Solver is a practical alternative, producing an analytical solution for the mesh of complex impedences represented in the netlist, in an order of magnitude less computing time.

22933 (ESTSC–000830MLTPL00) **XDAMP. Experimental Time-Dependent Data Analysis, Manipulation, Visualization GUI.** Ballard, W.P. (Sandia National Labs., Albuquerque, NM (United States)). Sandia National Labs., Albuquerque, NM (United States). 1 Apr 1995. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Source: ESTSC.

Description: MLT-PLTFM; Determined by IDL relase. IDL muX-DAMP is written entirely as a macro using the IDL Language to

allow portability,; 1 3.5 Diskette. The following file naming conventions are used: *.pro for IDL procedures, *.cmn for IDL common blocks, *.hdf for hierarchical data format files, xdamp.out is the output file, xdamp.ss is a spreadhseet importable file automatically generated by some commands, manual.ps is the PostScript manual file included in the distribution, *dcf is a xdamp macro command file, ASCII data outut files have the default extension .asc. The distriibution contains an AAREADME.TXT file that explains where to install the software using the rar command and how to print out the manual.

XDAMP is a graphical user interface (GUI) designed to allow the user to manipulate two-dimensional waveforms (data vs. time) that typically are generated during transient response experiments. A typical single data set from these facilities may generate more than 100 time-dependent waveforms. XDAMP can manipulate waveforms both in time and in amplitude. Typical operations are: time shifting, truncating before or after a specific time, adding, multiplying, integrating, and averaging. The software automatically maintains an audit trail for operations performed on each waveform. Annotation can be added to the overall file so that the data set contains full documentation. PostScript printing graphics and annotation is supported. Data are saved using the Hierarchical Data Format (HDF) from the National Center for Supercomputing Applications.

22934 (ESTSC–000835MLTPL00) **CORD-2. Core Design Applications.** Trkov, A. (Josef Stefan Institute, Ljubljana (Slovenia)). OECD Nuclear Energy Agency, 75 - Paris (France). 10 Jul 1994. Sponsored by National Endowment for the Arts, Washington, DC (United States). Source: ESTSC.

Description: MLT-PLTFM; Machine dependent; FORTRAN77; 2 3.5 Diskettes. To execute a sequence of codes as necessary for a realistic calculation, the use of job control language is inevitable, but it has been kept to a minimum for better code portability. Appropriate procedures are provided for VAX/VMS and PC/DOS systems. These may serve as examples to the user, to make adjustments for his specific requirements or implementation on other operating systems.

CORD-2 is intended for core desigh applications of pressurized water reactors. The main objective was to assemble a core design system which could be used for simple calculations (such as frequently required for fuel management) as well as for accurate calculations (for example, core design after refueling).

22935 (ESTSC–000847MLTPL00) **PDASAC. Partial Differential Algebraic Sensitivity Analysis Code.** Caracotsios, M. (Amoco Chemical Company, Naperville, IL (United States)); Stewart, W.E. Wisconsin Univ., Madison, WI (United States). Dept. of Chemical Engineering. 1 Feb 1995. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84ER13291. Source: ESTSC.

Description: MLT-PLTFM; PDASAC is in use on a wide varieWritten in Fortran and confroms largely to the Fortran 77 standard.; 1 3.5 Diskette. All floating-point numbers are expresssed in double precision. The Filename.FOR on the diskette denotes a Fortan source file, and Filename.DTA denotes an output data file. The .FOR files, when compiled and linked, suffice for execution of the four test problems given in the users' manual, APPENDIX C. The .DTA files correspond to the printed outputs of the four examples, given in Appendix C. These results were computed on a VAXstation 3200.

PDASAC solves stiff, nonlinear initial-boundary-value in a timelike dimension t and a space dimension x. Plane, circular cylindrical or spherical boundaries can be handled. Mixed-order systems of partial differential and algebraic equations can be analyzed with members of order or 0 or 1 in t, 0,1 or 2 in x. Parametric sensitivities of the calculated states are compted simultaneously on request, via the Jacobian of the state equations. Initial and boundary conditions are efficiently reconciled. Local error control (in the max-norm or the 2-norm) is provided for the state vector and can include the parametric sensitivites if desired.

22936 (ESTSC–001021U110000) **CPDREV. Spare Parts Inventory Control System.** Morgenthaler, A.C. (Rockwell Hanford Operations, Richland, WA (United States)). Fermi National Accelerator Lab., Batavia, IL (United States). 1 Feb 1979. Sponsored by USDOE, Washington, DC (United States). (NESC–947). Source: ESTSC.

Description: UNIVAC1100; SCOPE 3.4.4 (CDC6600;CYBER74); NFORTRAN (99%) and Assembly language (1%); 1 Mag Tape. Both machine versions assume that memory has been preset to zero prior to execution. THE CDC6600 version executes only on CDC systems containing the CYBER Record Manager; several calls are made to record manager routines within the program.

CPDREV was developed to determine proper stock levels for an inventory of process spare parts. The program determines the amount of material to buy, and when it should be bought. CPDREV can compute an implied risk from a prespecified penalty cost, or conversely, the implied penalty cost from a prespecified risk level. The frequency of reordering is computed to provide a basis for distributing the projected workload among buyers and expeditors and to avoid an overstocked inventory. CPDREV is designed to assist maintenance managers in preparing spare parts purchase recommendations.

22937 (ESTSC–001023SPARC00) **MTPOT. MTPOT is the Linkage Code Between Teapot and ZLIB.** Sun, N. (Superconducting Super Collider Laboratory, Waxahachie, TX, (United States)); Yang, Y.T.; Pilat, F.; Bourianoff, G. Fermi National Accelerator Lab., Batavia, IL (United States). 1 Feb 1994. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Source: ESTSC.

Description: SUN SPARC; SunOS, Unix; Fortran; 1 Mag Tape. File format given in SSCL-preprint-474 included in the documents.

MTpot can perform both element-by-element tracking and truncated Tylor map extraction and tracking.

22938 (ESTSC–001025SUN0000) **TRANSFER. Beam Transfer Simulation Program.** Yao, C.Y. (Superconducting Super Collider Laboratory, Waxahachie, TX, (United States)). Fermi National Accelerator Lab., Batavia, IL (United States). 1 Dec 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Source: ESTSC.

Description: SUN; SunOS, Unix; C (69%), Fortran (31%); 1 Mag Tape. Make executable file using 'make<CR>', 'icon' subdirectory contains icon files and should not be deleted.

Beam Transfer simulation package with GUI using X11/Motif.

22939 (ESTSC–001026SGIIP00) **BDL. Beam Dynamics Laboratory.** Cole, B. (Superconducting Super Collider Laboratory, Waxahachie, Tx, (United States)); Singleton, L. Fermi National Accelerator Lab., Batavia, IL (United States). 1 May 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Source: ESTSC.

Description: SILICON GRAPHIC; GL; C; 1 Mag Tape.

Simple model of an accelerator as it is running can be interactively manipulated to observe the effects of the manipulations of particle motion. The system can be used to demonstrte effects such as decoherence, slow-extraction, resonance islands, coupling resonance and synchro-betatron coupling.

22940 (ESTSC–001027SUN0000) **COOLWARM. Magnet Cooldown and Warmup Model.** Carcagno, R. H. (Superconducting Super Collider Laboratory, Waxahachie, TX (United States)). Fermi National Accelerator Lab., Batavia, IL (United States). 1 Feb 1994. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Source: ESTSC.

Description: SUN; Sun OS, VAX/VMS, MS-DOS, any thaFortran 77; 1 Mag Tape. For the Sun OS, type: f77 coolwarm.f heprop.f-0coolwarm. To run the program after the executable is created, type: coolwarm.

This program evaluates cooldown/warmup performance of an SSC magnet or magnet strings, But can be applied to any other iron coldmass which is cooled or warmed by helium.

22941 (ESTSC–001030IB48600) **CLF. Clean Lead Facility (CLF) Inventory System.** Garcia, J.F. (Lockheed Idaho Technologies Company, Idaho Falls, ID, (United States)). EG and G Idaho, Inc., Idaho Falls, ID (United States). 1 May 1995. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Source: ESTSC.

Description: IBM PC 486; MS-DOS 6.2 (or PC-DOS 6.3), Micr1 3.5 Diskette. Computer and Operating System Requirements are needed to operate the Inventory System. A complete understanding of the CLF Inventory System and the User's Manual is suggested to ensure data integrity.

The CLF Inventory System records shipments of clean or nonradioactive contaminated lead stored at the CLF. The Inventory System provides reports and inventory information to Facility operators. Annual, quarterly, monthly, and current inventory reports may be printed. Profile reports of each shipment of lead may also be printed for verification and documentation of lead transactions.

22942 (ESTSC–001031SUN0000) **XFLOW. Crossflow Cooling Analysis Program.** Yucel, Adnan (Superconducting Super Collider Laboratory, Waxahachie, TX (United States)). Fermi National Accelerator Lab., Batavia, IL (United States). 1 May 1992. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Source: ESTSC.

Description: SUN; Sun OS, VAX/VMS, MS-DOS, etc.; Fortran 77; 1 Tape. Compile and link xflow.f, descol.f, dnsqe.f and rkf45.f; then run the executable. File formats are given in README file in 'doc' directory.

Crossflow cooling analysis program to predict pressure drops and temperature rises in the annular and main cooling channels of collider dipole magnets (The upper channels are orificied at the inlet, the lower channels at the exits). Used in the analysis, design, and optimization of crossflow cooling for superconducting magnets.

22943 (ESTSC–001043CY00100) **BACON12. Bounce-Averaged Fokker-Planck Code.** Rognlien, T.D. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). 1 Apr 1988. Sponsored by USDOE, Washington, DC (United States). (NESC–9534). Source: ESTSC.

Description: CRAY1; CTSS; LRLTRAN (CIVIC); 1 Tape. BACON12 calls several routines specific to the LLNL computing environment; these routines are not included.

BACON12 solves the Fokker-Planck equation for electron or ion distribution, f(v,theta), confined in an electrostatic and magnetic well, where (v,theta) are spherical velocity coordinates with theta measured with respect to the static magnetic field. It was developed to model ions trapped in a magnetic mirror. The influences of Coulomb collision, radio frequency heating, and neutral beam injection are included. The code calculates the particle and energy confinement time of particles confined in a magnetic well. BACON12 is written in conservation form, which results in the line density being conserved exactly except at phase space boundaries.

22944 (ESTSC–001044C760000) **BASELIB. a library of basic system functions.** Getchell, A. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). 1 Nov 1983. Sponsored by USDOE, Washington, DC (United States). (NESC–9899). Source: ESTSC.

Description: CDC7600; LTSS; COMPASS; 1 Mag Tape.

BASELIB is a support library for developing high-level library software. Its design is adaptable to other applications (utility routines, compilers, loaders, large application systems, etc.). BASELIB functions perform commonly-used system and I/O requests available in LTSS operating systems. BASELIB routines are machine-dependent; they are closely tied to the machine and operating system for which they were programmed. However, an attempt was made to maintain compatibility and consistency across machines at the BASELIB calling level to provide a common base for moving large software systems across machines. It allows the programmer to structure higher-level software in a machine- independent fashion. Miscellaneous routines are included to perform character and string manipulation, number conversion, and output-file name generation.

22945 (ESTSC–001044CY00100) **BASELIB. A Library of Basic System Functions.** Getchell, A. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). 1 Nov 1988. Sponsored by USDOE, Washington, DC (United States). (NESC–9899). Source: ESTSC.

Description: CRAY1; CTSS; CAL (86%) and LRLTRAN (14%); 1 Mag Tape.

BASELIB is a support library for developing high-level library software. Its design is adaptable to other applications (utility routines, compilers, loaders, large application systems, etc.). BASELIB functions perform commonly-used system and I/O requests available in LTSS operating systems. BASELIB routines are machine dependent; they are closely tied to the machine and operating system for which they were programmed. However, an attempt was made to maintain compatibility and consistency across machines at the BASELIB calling level to provide a common base for moving large software systems across machines. It allows the programmer to structure higher level software in a machine independent fashion. Miscellaneous routines are included to perform character and string manipulation, number conversion, and output-file name generation.

22946 (ESTSC–001047C007400) **GEOCITY. Geothermal District Heating Economics.** Huber, H.D. (Pacific Northwest Lab., Richland, WA (United States)); McDonald, C.L.; Bloomster, C.H.; Schulte, S.C. Pacific Northwest Lab., Richland, WA (United States). 1 Oct 1978. Sponsored by USDOE, Washington, DC (United States). (NESC–835). Source: ESTSC.

Description: CDC CYBER74; SCOPE 3.4.2; FORTRAN IV; 1 Tape. GEOCITY includes 63 subroutines comprising the 1967 ASME Steam Tables which are used to calculate the thermodynamic and physical properties of water, including pressure, temperature, enthalpy, specific volume, density, viscosity, and fluid quality. The NAMELIST utility is used to process the GEOCITY input data.

GEOCITY is a large-scale simulation model which combines both engineering and economic submodels to systematically calculate the cost of geothermal district heating systems for space heating, hot-water heating, and process heating based upon hydrothermal geothermal resources. The GEOCITY program simulates the entire production, distribution, and waste disposal process for geothermal district heating systems, but does not include the cost of radiators, convectors, or other in-house heating systems. GEOCITY calculates the cost of district heating based on the climate, population, and heat demand of the district; characteristics of the geothermal resource and distance from the distribution center; well-drilling costs; design of the distribution system; tax rates; and financial conditions.

22947 (ESTSC–001055D664000) **SWTK. Software Tracking Systems.** Laurie Harness (SSC Laboratory, Information Services (United States)); Laural McGilvery. Fermi National Accelerator Lab., Batavia, IL (United States). 27 Sep 1994. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Source: ESTSC.

Description: DEC VAX6640; DEC VMS 5.5-2; DEC VMS DCL, Oracle SQL*Plus, Oracle SQL*Forms, Oracle SQL*Menu. None.

The Software Tracking System was used to track single user software licenses and MacRanch (Keyserver) licenses at the SSCL. Information retained on software concerned the identification and the issuee for each license. During the SSCL termination, the application will record the final distribution of the software per DOE orders.

22948 (ESTSC–001056IBMPC00) **OLIGOSYN. Hardware Controller DNA Synthesizer.** Sindelar, L.E. (Lawrence Berkeley National Laboratory, Berkeley, CA, (United States)). Lawrence Berkeley Lab., CA (United States). 24 Jan 1994. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Source: ESTSC.

Description: IBM PC; MS-DOS, Version 5.00 (off the shMicrosoft Visual Basic, Version 3.0 (100%); 1 3.5 Diskette. The software is written in Visual Basic Programming language and as such the Microsoft Visual Basic, Version 3.0 file naming conventions are used.

The program controls the operation of various hardware components of an automatic 12-channel parrallel oligosynthesizer. This involves accepting information regarding the DNA sequence to be generated and converting this into a series of instructions to I/O ports to actuate the appropriate hardware components. The design and function of the software is specific to a particular hardware platform and has no utility for controlling other configurations.

22949 (ESTSC–001057D642000) **STAR. System for Tracking Applicants and Resumes.** Mark Aiken (SSC Laboratory, Information Services (United States)); Terry Teague; Andy Wall. Fermi National Accelerator Lab., Batavia, IL (United States). 6 Jan 1993. Sponsored by USDOE, Washington, DC (United States). Source: ESTSC.

Description: DEC VAX6420; DEC VMS 5.5-2; Powerhouse, DEC VMS DCL. None.

The STAR System was used by the Recruiting office to track job applicants and requisitions for personnel at the SSCL.

22950 (FNAL/C–95/056) **Collaborating over the web: Libraries and laboratries or the librarian and the webmaster.** Garrett, P. (Sydney Univ., NSW (Australia). Fisher Library); Ritchie, D.J. Fermi National Accelerator Lab., Batavia, IL (United States). Mar 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9504144–1: AusWeb '95: 1. Austrialian WWW conference, New South Wales (Australia), 29 Apr - 2 may 1995). Order Number DE95010572. Source: OSTI; NTIS; INIS; GPO Dep.

Fermilab [HREF1] has been using World Wide Web [HREF2] (WWW) servers and browsers for the past several years. The purpose has been to allow information sharing within internationally dispersed teams of large collaborations of high energy physics experimenters and to make possible the easy dissemination of information by support groups who work with those collaborations. That is, the purpose has been in fact that for which was created at CERN [HREF3] beginning in March 1989. In the remainder of this paper, we describe the architecture of the Laboratory and Library servers, discuss the goals, the implications of those goals, the drivers of structure and content, and the effect of these factors on the architecture. Comparisons are made. The implications for Libraries within organizations are described. The application to large Libraries which begin to have multiple servers within their own organization (e.g., one in reference, one in cataloging, one in circulation) is made. The broader implications are discussed.

22951 (LA-UR–95-1221) **Elements of a theory of simulation.** Rasmussen, S. (Los Alamos National Lab., NM (United States)); Barrett, C.L. Los Alamos National Lab., NM (United States). [1995]. 16p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9509164–1: European conference on artifical life (ECAL), Barcelona (Spain), Sep 1995). Order Number DE95012995. Source: OSTI; NTIS; GPO Dep.

Artificial Life and the more general area of Complex Systems does not have a unified theoretical framework although most theoretical work in these areas is based on simulation. This is primarily due to an insufficient representational power of the classical mathematical frameworks for the description of discrete dynamical systems of interacting objects with often complex internal states. Unlike computation or the numerical analysis of differential equations, simulation does not have a well established conceptual and mathematical foundation. Simulation is an arguable unique union of modeling and computation. However, simulation also qualifies as a separate species of system representation with its own motivations, characteristics, and implications. This work outlines how simulation can be rooted in mathematics and shows which properties some of the elements of such a mathematical framework has. The properties of simulation are described and analyzed in terms of properties of dynamical systems. It is shown how and why a simulation produces emergent behavior and why the analysis of the dynamics of the system being simulated always is an analysis of emergent phenomena. Indeed, the single fundamental class of properties of the natural world that simulation will open to new understanding, is that which occurs only in the dynamics produced by the interactions of the components of complex systems. Simulation offers a synthetic, formal framework for the experimental mathematics of representation and analysis of complex dynamical systems. A notion of a universal simulator and the definition of simulatabuity is proposed. This allows a description of conditions under which simulations can distribute update functions over system components, thereby determining simulatability. The connection between the notion of simulatability and the notion of computability is defined and the concepts are distinguished.

22952 (LA-UR–95-1411) **Bicriteria network design problems.** Marathe, M.V. (Los Alamos National Lab., NM (United States)); Ravi, R.; Sundaram, R.; Ravi, S.S.; Rosenkrantz, D.J.; Hunt, H.B. III. Los Alamos National Lab., NM (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9506188–1: International coloquium on automata languages (ICALP '95), Szeged (Hungary), Jun 1995). Order Number DE95012052. Source: OSTI; NTIS; GPO Dep.

We study several bicriteria network design problems phrased as follows: given an indirected graph and two minimization objectives with a budget specified on one objective, find a subgraph satisfying certain connectivity requirements that minimizes the second objective subject to the budget on the first. First, we develop a formalism for bicriteria problems and their approximations. Secondly, we use a simple parametric search technique to provide bicriteria approximation algorithms for problems with two similar criteria, where both criteria are the same measure (such as the diameter or the total cost of a tree) but differ only in the cost function under which the measure is computed. Thirdly, we present an (O(log n), O(log n))-approximation algorithm for finding a diameter-constrained minimum cost spanning tree of an undirected graph on n nodes. Finally, for the class of treewidth-bounded graphs, we provide pseudopolynomial-time algorithms for a number of bicriteria problems using dynamic programming. These pseudopolynomial-time algorithms can be converted to fully polynomial-time approximation schemes using a scaling technique.

22953 (LBL–36680) **A distributed parallel storage architecture and its potential application within EOSDIS.** Johnston, W.E. (Lawrence Berkeley Lab., CA (United States)); Tierney, B.; Feuquay, J.; Butzer, T. Lawrence Berkeley Lab., CA (United States). Jan 1995. 14p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9503106–2: Goddard conference on mass storage and technolgies, College Park, MD (United States), 28-30 Mar 1995). Order Number DE95012325. Source: OSTI; NTIS; GPO Dep.

We describe the architecture, implementation, use, and potential use of a scale, high-performance, distributed-parallel data storage system developed in the ARPA funded MAGIC gigabit testbed. A collection of wide area distributed disk servers operate in parallel to provide logical block level access to large data sets. Operated primarily as a network-based cache, the architecture supports cooperation among independently owned resources to provide fast, large-scale, on-demand storage to support data handling, simulation, and computation.

22954 (NUREG/CR–0200-Vol.2-Pt.2-Rev.4) **SCALE: A modular code system for performing standardized computer analyses for licensing evaluation. Functional modules F9–F16 – Volume 2, Part 2, Revision 4.** West, J.T. (Oak Ridge National Lab., TN (United States)); Hoffman, T.J.; Emmett, M.B.; Childs, K.W.; Petrie, L.M.; Landers, N.F.; Bryan, C.B.; Giles, G.E. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Industrial and Medical Nuclear Safety; Oak Ridge National Lab., TN (United States). Apr 1995. 853p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/NUREG/CSD–2/R4-Vol.2-Pt.2). Source: OSTI; NTIS; GPO; INIS.

SCALE–a modular code system for Standardized Computer Analyses Licensing Evaluation–has been developed by Oak Ridge National Laboratory at the request of the US Nuclear Regulatory Commission. The SCALE system utilizes well-established computer codes and methods within standard analysis sequences that (1) allow an input format designed for the occasional user and/or novice, (2) automate the data processing and coupling between modules, and (3) provide accurate and reliable results. System development has been directed at problem-dependent cross-section processing and analysis of criticality safety, shielding, heat transfer, and depletion/decay problems. Since the initial release of SCALE in 1980, the code system has been heavily used for evaluation of nuclear fuel facility and package designs. This revision documents Version 4.2 of the system. The manual is divided into three volumes: Volume 1–for the control module documentation, Volume 2–for

functional module documentation; and Volume 3–for documentation of the data libraries and subroutine libraries. This volume discusses the following functional modules: MORSE-SGC; HEATING 7.2; KENO V.a; JUNEBUG-II; HEATPLOT-S; REGPLOT 6; PLORIGEN; and OCULAR.

22956 (PNL-SA–25658) **Performance of a fully parallel dense real symmetric eigensolver in quantum chemistry applications.** Fann, G.I.; Littlefield, R.J.; Elwood, D.M. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950439–11: SMS simulation multiconference: simulation as a critical technology, Phoenix, AZ (United States), 9-13 Apr 1995). Order Number DE95011496. Source: OSTI; NTIS; GPO Dep.

The parallel performance of a dense, standard and generalized, real, symmetric eigensolver based on bisection for eigenvalues and repeated inverse iteration and reorthogonalization for eigenvectors is described. The performance of this solver, called PeIGS, is given for two test problems and for three "real-world" quantum chemistry applications: SCF-Hartree-Fock, density functional theory,and Moeller-Plesset theory. The distinguishing feature of the repeated inverse iteration and orthogonalization method used by PEIGS is that orthogonalization may be performed across multiple processors as dictated by the spectrum. For each problem we describe the spectrum and the clustering of the eigenvalues, the most important factor in determining the execution time. For a spectrum that is well spaced, there is essentially no orthogonalization time. Most of the time is consumed in the Householder reduction to tridiagonal form. For large clusters, almost all of the time is consumed in the Householder reduction and in orthogonalization. Performance results from the Intel Paragon, and Kendall Square Research KSR-2 are reported.

22957 (PNL-SA–25920) **Workshop on environmental and energy applications of neural networks.** Hashem, S. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9503142–1: Workshop on environmental and energy applications of neural networks conference, Richland, WA (United States), 30-31 Mar 1995). Order Number DE95011419. Source: OSTI; NTIS; INIS; GPO Dep.

This report consists of the abstracts for the papers given at the conference. Applications of neural networks in the environmental, energy and biomedical fields are discussed. Some of the topics covered are: predicting atmospheric pollutant concentrations due to fossil-fired electric power generation; hazardous waste characterization; nondestructive TRU (transuranic) waste assay; risk analysis; load forecasting for electric utilities; design of a wind power storage and generation system; nuclear fuel management; etc.

22958 (SAND–95-0753C) **A reconfigurable optoelectronic interconnect technology for multi-processor networks.** Lu, Y.C. (Univ. of New Mexico, Albuquerque, NM (United States). Center for High Technology Materials); Cheng, J.; Zolper, J.C.; Klem, J. Sandia National Labs., Albuquerque, NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505121–3: 45. electronic components and technology conference, Las Vegas, NV (United States), 22-26 May 1995). Order Number DE95011895. Source: OSTI; NTIS; GPO Dep.

This paper describes a new optical interconnect architecture and the integrated optoelectronic circuit technology for implementing a parallel, reconfigurable, multiprocessor network. The technology consists of monolithic array's of optoelectronic switches that integrate vertical-cavity surface-emitting lasers with three-terminal heterojunction phototransistors, which effectively combined the functions of an optical transceiver and an optical spatial routing switch. These switches have demonstrated optical switching at 200 Mb/s, and electrical-to-optical data conversion at $>$ 500 Mb/s, with a small-signal electrical-to-optical modulation bandwidth of $\sim$ 4 GHz.

22959 (SAND–95-1083C) **Lower bounds for randomized Exclusive Write PRAMs.** MacKenzie, P.D. Sandia National Labs., Albuquerque, NM (United States). 2 May 1995. 24p. Sponsored by USDOE, Washington, DC (United States);Texas State Government, Austin, TX (United States). DOE Contract AC04-94AL85000. (CONF-9507132–1: Symposium on parallel algorithms and architectures, Santa Barbara, CA (United States), 17-19 Jul 1995). Order Number DE95013022. Source: OSTI; NTIS; GPO Dep.

In this paper we study the question: How useful is randomization in speeding up Exclusive Write PRAM computations? Our results give further evidence that randomization is of limited use in these types of computations. First we examine a compaction problem on both the CREW and EREW PRAM models, and we present randomized lower bounds which match the best deterministic lower bounds known. (For the CREW PRAM model, the lower bound is asymptotically optimal.) These are the first non-trivial randomized lower bounds known for the compaction problem on these models. We show that our lower bounds also apply to the problem of approximate compaction. Next we examine the problem of computing boolean functions on the CREW PRAM model, and we present a randomized lower bound, which improves on the previous best randomized lower bound for many boolean functions, including the OR function. (The previous lower bounds for these functions were asymptotically optimal, but we improve the constant multiplicative factor.) We also give an alternate proof for the randomized lower bound on PARITY, which was already optimal to within a constant additive factor. Lastly, we give a randomized lower bound for integer merging on an EREW PRAM which matches the best deterministic lower bound known. In all our proofs, we use the Random Adversary method, which has previously only been used for proving lower bounds on models with Concurrent Write capabilities. Thus this paper also serves to illustrate the power and generality of this method for proving parallel randomized lower bounds.

22960 (SSCL–485) **Averaging in the presence of sliding errors.** Yost, G.P. (Superconducting Super Collider Lab., Dallas, TX (United States)). Superconducting Super Collider Lab., Dallas, TX (United States). Aug 1991. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. G phy-8907526; G phy-8811054; G 85-07153. Order Number DE95011144. Source: OSTI; NTIS; INIS; GPO Dep.

In many cases the precision with which an experiment can measure a physical quantity depends on the value of that quantity. Not having access to the true value, experimental groups are forced to assign their errors based on their own measured value. Procedures which attempt to derive an improved estimate of the true value by a suitable average of such measurements usually weight each experiment's measurement according to the reported variance. However, one is in a position to derive improved error estimates for each experiment from the average itself, provided an approximate idea of the functional dependence of the error on the central

value is known. Failing to do so can lead to substantial biases. Techniques which avoid these biases without loss of precision are proposed and their performance is analyzed with examples. These techniques are quite general and can bring about an improvement even when the behavior of the errors is not well understood. Perhaps the most important application of the technique is in fitting curves to histograms.

22961 (SSCL-Preprint–61) **DECwrite v2.0: A novice's perspective.** Damrau, J. Superconducting Super Collider Lab., Dallas, TX (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-9212135–1: Winter DECUS conference, Las Vegas, NV (United States), 7-11 Dec 1992). Order Number DE95011049. Source: OSTI; NTIS; INIS; GPO Dep.

This paper will show why I changed from using TeX to using DECwrite. The advantages for doing this are the import/export features, online readability through the Export to Bookreader – function, and its user-friendliness (similar to Microsoft Word, but more powerful). Another prime advantage of using DECwrite is the elimination of paper waste through the online readability format through the use of Bookreader.

22962 (SSCL-Preprint–547) **Bridging FORTRAN to object oriented paradigm for HEP data modeling task.** Huang, J. Superconducting Super Collider Lab., Dallas, TX (United States). Dec 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-9310317–1: 3. international workshop on software engineering, artifical intelligence (AI) and expert systems for high energy and nuclear physics, Oberammergau (Germany), 4-8 Oct 1993). Order Number DE95011032. Source: OSTI; NTIS; INIS; GPO Dep.

Object oriented (OO) technology appears to offer tangible benefits to the high energy physics (HEP) community. Yet many physicists view this newest software development used with much reservation and reluctance. Facing the reality of having to support the existing physics applications, which are written in FORTRAN, the software engineers in the Computer Engineering Group of the Physics Research Division at the Superconducting Super Collider Laboratory have accepted the challenge of mixing an old language with the new technology. This paper describes the experience and the techniques devised to fit FORTRAN into the OO paradigm (OOP).

22963 (UCRL-JC–118794) **A comparison of risk assessment techniques from qualitative to quantitative.** Altenbach, T.J. Lawrence Livermore National Lab., CA (United States). 13 Feb 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950740–36: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95011430. Source: OSTI; NTIS; GPO Dep.

Risk assessment techniques vary from purely qualitative approaches, through a regime of semi-qualitative to the more traditional quantitative. Constraints such as time, money, manpower, skills, management perceptions, risk result communication to the public, and political pressures all affect the manner in which risk assessments are carried out. This paper surveys some risk matrix techniques, examining the uses and applicability for each. Limitations and problems for each technique are presented and compared to the others. Risk matrix approaches vary from purely qualitative axis descriptions of accident frequency vs consequences, to fully quantitative axis definitions using multi-attribute utility theory to equate different types of risk from the same operation.

22964 (UCRL-JC–119044) **PMESH: A parallel mesh generator.** Hardin, D.D. Lawrence Livermore National Lab., CA (United States). 21 Oct 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9410254–8: Nuclear explosives code developers conference (NECDC), Las Vegas, NV (United States), 27 Oct 1994). Order Number DE95011761. Source: OSTI; NTIS; GPO Dep.

The Parallel Mesh Generation (PMESH) Project is a joint LDRD effort by A Division and Engineering to develop a unique mesh generation system that can construct large calculational meshes (of up to 10^9 elements) on massively parallel computers. Such a capability will remove a critical roadblock to unleashing the power of massively parallel processors (MPPs) for physical analysis. PMESH will support a variety of LLNL 3-D physics codes in the areas of electromagnetics, structural mechanics, thermal analysis, and hydrodynamics.

22965 (UCRL-JC–119205) **Parallelizing Monte Carlo with PMC.** Rathkopf, J.A.; Jones, T.R.; Nessett, D.M.; Stanberry, L.C. Lawrence Livermore National Lab., CA (United States). Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9410254–7: Nuclear explosives code developers conference (NECDC), Las Vegas, NV (United States), 27 Oct 1994). Order Number DE95010749. Source: OSTI; NTIS; INIS; GPO Dep.

PMC (Parallel Monte Carlo) is a system of generic interface routines that allows easy porting of Monte Carlo packages of large-scale physics simulation codes to Massively Parallel Processor (MPP) computers. By loading various versions of PMC, simulation code developers can configure their codes to run in several modes: serial, Monte Carlo runs on the same processor as the rest of the code; parallel, Monte Carlo runs in parallel across many processors of the MPP with the rest of the code running on other MPP processor(s); distributed, Monte Carlo runs in parallel across many processors of the MPP with the rest of the code running on a different machine. This multi-mode approach allows maintenance of a single simulation code source regardless of the target machine. PMC handles passing of messages between nodes on the MPP, passing of messages between a different machine and the MPP, distributing work between nodes, and providing independent, reproducible sequences of random numbers. Several production codes have been parallelized under the PMC system. Excellent parallel efficiency in both the distributed and parallel modes results if sufficient workload is available per processor. Experiences with a Monte Carlo photonics demonstration code and a Monte Carlo neutronics package are described.

22966 (UCRL-JC–120490) **Using distributed OLTP technology in a high performance storage system.** Tyler, T.W. (IBM Government Systems, Houston, TX (United States)); Fisher, D.S. Lawrence Livermore National Lab., CA (United States). Mar 1995. 10p. Sponsored by USDOE, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950985–2: 14. Institute of Electrical and Electronics Engineers (IEEE) symposium on mass storage systems, Monterey, CA (United States), 11-14 Sep 1995). Order Number DE95011004. Source: OSTI; NTIS; GPO Dep.

The design of scaleable mass storage systems requires various system components to be distributed across multiple processors. Most of these processes maintain persistent database-type information (i.e., metadata) on the resources they are responsible for managing (e.g., bitfiles, bitfile segments, physical volumes, virtual volumes, cartridges, etc.). These processes all participate in fulfilling end-user requests and updating metadata information. A number of challenges arise when distributed processes attempt to maintain separate metadata resources with production-level integrity and consistency. For example, when requests fail, metadata changes made by the various processes must be aborted or rolled back. When requests are successful, all metadata changes must be committed together. If all metadata changes cannot be committed together for some reason, then all metadata changes must be rolled back to the previous consistent state. Lack of metadata consistency jeopardizes storage system integrity. Distributed on-line transaction processing (OLTP) technology can be applied to distributed mass storage systems as the mechanism for managing the consistency of distributed metadata. OLTP concepts are familiar to manN, industries such as banking and financial services but are less well known and understood in scientific and technical computing. As mass storage systems and other products are designed using distributed processing and data-management strategies for performance, scalability, and/or availability reasons, distributed OLTP technology can be applied to solve the inherent challenges raised by such environments. This paper discusses the benefits in

using distributed transaction processing products. Design and implementation experiences using the Encina OLTP product from Transarc in the High Performance Storage System are presented in more detail as a case study for how this technology can be applied to mass storage systems designed for distributed environments.

22967 (UCRL-JC-120716) **S.M.A.R.T. map: Site map attribute retrieval technique.** Brown-Rall, M. Lawrence Livermore National Lab., CA (United States). 29 Mar 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9504158-2: CAD/CAE conference, Atlanta, GA (United States), 19 Apr 1995). Order Number DE95014126. Source: OSTI; NTIS; GPO Dep.

Plant Engineering's Space and Site Planning (S&SP) organization at Lawrence Livermore National Laboratory (LLNL) has developed a new tool, which is a computerized mapping system that can graphically illustrate facility characteristics. The current "base" map being used is the LLNL Site Map prepared by Plant Engineering's CADD Support group. Using current information in the Facility Information Tracking System (FITS) database, a Microsoft Excel spreadsheet, an electronic sort can be made, tying in the AutoCAD-generated site map to specific database fields. This link is accomplished by using a software overlay called the CadPLUS InfoEngine. The fields in the database include such things as, facility number, occupant program, population, facility age, facility quality, security level, etc. By selecting one or a combination of the fields, a map is generated, illustrating in color and hatch patterns the facilities or entities that are associated with the chosen fields. This process can be very useful for seeing the LLNL site at a glance, with highlighted characteristics for particular areas of interest. The generation of large complex graphics, using large-scale databases selectively, can be accomplished quickly. These extractions and links between data and graphics create a S.M.A.R.T. Map.

22968 (UCRL-LR-119304) **Dependency visualization for complex system understanding.** Smart, J.A.C. Lawrence Livermore National Lab., CA (United States). Sep 1994. 277p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011699. Source: OSTI; NTIS; GPO Dep.

With the volume of software in production use dramatically increasing, the importance of software maintenance has become strikingly apparent. Techniques now sought and developed for reverse engineering and design extraction and recovery. At present, numerous commercial products and research tools exist which are capable of visualizing a variety of programming languages and software constructs. The list of new tools and services continues to grow rapidly. Although the scope of the existing commercial and academic product set is quite broad, these tools still share a common underlying problem. The ability of each tool to visually organize object representations is increasingly impaired as the number of components and component dependencies within systems increases. Regardless of how objects are defined, complex "spaghetti" networks result in nearly all large system cases. While this problem is immediately apparent in modern systems analysis involving large software implementations, it is not new. As will be discussed in Chapter 2, related problems involving the theory of graphs were identified long ago. This important theoretical foundation provides a useful vehicle for representing and analyzing complex system structures. While the utility of directed graph based concepts in software tool design has been demonstrated in literature, these tools still lack the capabilities necessary for large system comprehension. This foundation must therefore be expanded with new orgnizational and visualization constructs necessary to meet this challenge. This dissertation addresses this need by constructing a conceptual model and a set of methods for interactively exploring, organizing, and understanding the structure of complex software systems.

22969 (UCRL-LR-120452) **An object-oriented extension for debugging the virtual machine.** Pizzi, R.G. Jr. (California Univ., Davis, CA (United States)). Lawrence Livermore National Lab., CA (United States). Dec 1994. 109p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013229. Source: OSTI; NTIS; GPO Dep.

A computer is nothing more then a virtual machine programmed by source code to perform a task. The program's source code expresses abstract constructs which are compiled into some lower level target language. When a virtual machine breaks, it can be very difficult to debug because typical debuggers provide only low-level target implementation information to the software engineer. We believe that the debugging task can be simplified by introducing aspects of the abstract design and data into the source code. We introduce OODIE, an object-oriented extension to programming languages that allows programmers to specify a virtual environment by describing the meaning of the design and data of a virtual machine. This specification is translated into symbolic information such that an augmented debugger can present engineers with a programmable debugging environment specifically tailored for the virtual machine that is to be debugged.

Project objectives are to provide the resources and capabilities to permit the State of California to conduct Area of Review (AOR) variance analyses on a statewide level, and includes: (1) the analysis and identification of areas that may qualify for AOR variances; (2) the correlation of information from various databases and other automated systems to conduct AORs in areas that do not qualify for variances; (3) the evaluation of the risk of pollution, during permitting and monitoring, using risk based data analysis; and (4) the conduct of spatial analyses of injection well data in conjunction with other geographically referenced information. The Division has identified the hardware and software equipment needed to implement the Risk Based Data Management System (RBDMS) and conduct AOR variances. A workshop to review the RBDMS was held on April 4, 1995 with Dan Arthur from CH2M Hill, Inc. Oil and gas industry representatives were invited to attend and were asked for their support by submitting digitized well information to populate the Division's data base.

22972 (ES/ER/TM-137) **Results of the user survey of functional requirements for the Oak Ridge Environmental Information System.** Oak Ridge National Lab., TN (United States). Mar 1995. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95013299. Source: OSTI; NTIS; GPO Dep.

Environmental Restoration Program.

The Oak Ridge Environmental Information System (OREIS) user survey of functional requirements was conducted in the spring and summer of 1994 to allow representatives of the OREIS user community to review and confirm the functionality of the OREIS system and to provide a method to document user acceptance of the system. The results of the survey confirm that the OREIS system meets data and functional requirements of the users. It further emphasizes that the user community is quite diverse, with many different needs for and perspectives about OREIS, and with varying needs for access and use of software tools. To meet the needs of a diverse and potentially changing user community, OREIS staff will survey the user community periodically to obtain input on changes to user requirements for future versions of the system.

22973 (NUREG–0540-Vol.17-No.3) **Title list of documents made publicly available, March 1–31, 1995: Volume 17, No. 3.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Freedom of Information and Publications Services. May 1995. 376p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

The Title List of Documents Made Publicly Available is a monthly publication. It contains descriptions of the information received and generated by the US Nuclear Regulatory Commission (NRC). This information includes (1) docketed material associated with civilian nuclear power plants and other uses of radioactive materials and (2) nondocketed material received and generated by NRC pertinent to its role as a regulatory agency. As used here, docketed does not refer to Court dockets; it refers to the system by which NRC maintains its regulatory records. This series of documents is indexed by a Personal Author Index, a Corporate Source Index, and a Report Number Index. The docketed information contained in the Title List includes the information formerly issued through the Department of Energy publication Power Reactor Docket Information, last published in January 1979. NRC documents that are publicly available may be examined without charge at the NRC Public Document Room (PDR). Duplicate copies may be obtained for a fee. Standing orders for certain categories of documents are also available. Clients may search for and order desired titles through the PDR computerized Bibliographic Retrieval System, which is accessible both at the PDR and remotely. The PDR is staffed by professional technical librarians, who provide reference assistance to users. See NOTES at the end of the preface for information about reaching the PDR. Microfiche of the docketed information listed in the Title List is available for sale on a subscription basis from the National Technical Information Service (NTIS).

22974 (PNL-SA–25720) **The visual analysis of textual information: Browsing large document sets.** Thomas, J. (Pacific Northwest Lab., Richland, WA (United States)); Pennock, K.; Fiegel, T.; Wise, J.; Pottier, M.; Schur, A.; Crow, V.; Lantrip, D. Pacific Northwest Lab., Richland, WA (United States). May 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9505210–1: DL '95 conference, Washington, DC (United States), 15-19 May 1995). Order Number DE95011488. Source: OSTI; NTIS; GPO Dep.

Visualization tools have been invaluable in the process of scientific discovery by providing researchers with insights gained through graphical tools and techniques. At PNL, the Multidimensional Visualization and Advanced Browsing (MVAB) project is extending visualization technology to the problems of intelligence analysis of textual documents by creating spatial representations of textual information. By representing an entire corpus of documents as points in a coordinate space of two or more dimensions, the tools developed by the MVAB team give the analyst the ability to quickly browse the entire document base and determine relationships among documents and publication patterns not readily discernible through traditional lexical means.

22975 (SAND–89-0996-Rev.) **Guide to preparing SAND reports. Revision.** Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 229p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010196. Source: OSTI; NTIS; GPO Dep.

Supersedes SAND89-0996 dated September 1994.

This guide contains basic information needed to produce a SAND report; its guidelines reflect DOE regulations and Sandia policy. The guide includes basic writing instructions in an annotated sample report; guidance for organization, format, and layout of reports produced by line organizations; and information about conference papers, journal articles, and brochures. The appendixes contain sections on Sandia's preferred usage, equations, references, copyrights and permissions, and publishing terms.

22976 (UCRL-ID–120609) **Pratt and Whitney digital data delivery to San Antonio Air Logistics Centers EDCARS repository data: MIL-R-28002A Type 1 (Raster). Quick short test report.** Lawrence Livermore National Lab., CA (United States). Sep 1994. 49p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012479. Source: OSTI; NTIS; GPO Dep.

This report describes the effort undertaken by the principal participants: Pratt and Whitney, San Antonio-Air Logistics Center (SA-ALC), and the Air Force CALS Test Network (AFCTN), in developing a Continuous Acquisition and Life-cycle Support (CALS) digital data delivery process for PW229 Engine technical data. Both source and destination teams agree this delivery demonstrated a positive business case and additional potential for comprehensive process reengineering.

22977 (WSRC-MS–95-0031) **Incorporating bibliographic information into a spatial data query system for the Savannah River Site.** Cowen, D.J. (Univ. of South Carolina, Columbia, SC (United States). Dept. of Geography); Jensen, J.R.; MacCharles, C.V.; Holliday, W.N.; White, T.R.; Mackey, H.E. Jr. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9503141–1: Annual meeting of Society of Photogrammetry and Remote Sensing, Charlotte, NC (United States), 27 Mar - 2 apr 1995). Order Number DE95010965. Source: OSTI; NTIS; GPO Dep.

Over the past two years the Environmental Sciences Section of the Westinghouse Savannah River Company and the University of South Carolina have developed a full-featured spatial data query system for the Savannah River Site. This Environmental Data Atlas, which operates across multiple platforms, is designed to provide scientists with easy access to a wide range of GIS and remote sensing data resources. This paper describes the method that has been developed to extend the Environmental Data Atlas to incorporate bibliographical data. The bibliographic search function was determined by the scientists to be an extremely important enhancement that will enable them to utilize geographic keys to locate obscure references and databases. The method uses a Hot Link function to launch a parsing algorithm by pointing to geographic features. The parsing algorithm efficiently sorts through a list of references based on the keyword associated with the feature. The matched bibliographical entries are formatted into a text file that is displayed in a scrollable window. Any graphics associated with the actual reference can also be scanned and linked to an additional Hot Link. An additional parsing system was used to automatically create the bibliographical database from a comprehensive CD-ROM version of the Environmental Information Document prepared by the Environmental Sciences Section. This extensive digital reference represents a summary of much of the recent ecological information available on the site. The methods used in this system are directly linked to a commercially available software and provide a universal approach to establishing a geographically based document retrieval system.

Corporate Author Index

This index lists the corporate authors responsible for issuing the documents in this publication which are identified primarily by report number. The corporate names are entered in standardized forms as defined in ETDE/PUB–3 (Rev.1), *International Energy: Research Organizations 1988–1992*. Each entry under a corporate name includes the document title and citation number. Three items of information may appear in parentheses: (1) an abbreviation to identify the document type, such as a report; (2) the country of publication, indicated by International Organization for Standardization (ISO) country code; and (3) the language of the document if non-English (R;CA;In French). Author affiliations are not listed in this index.

Strategies for reconciling environmental goals, productivity improvement, and increased energy efficiency in the industrial sector: Analytic framework, 20:22900 (R;US)
Structure and properties of heteroepitaxial $Pb(Zr_{0.35}Ti_{0.65})O_3/SrRuO_3$ multilayer thin films on $SrTiO_3(100)$ prepared by MOCVD and RF sputtering, 20:21609 (R;US)
Study of field ionization in the charge exchange injection for the IPNS upgrade, 20:21938 (R;US)
Sulfide ceramics in molten-salt electrolyte batteries, 20:21328 (R;US)
Summary report for ITER Task-T19: MHD pressure drop and heat transfer study for liquid metal systems, 20:22874 (R;US)
Surface brillouin scattering from graphite, 20:21642 (R;US)
Surface heat flux data from energy balance Bowen ratio systems, 20:22154 (R;US)
Synthesis, properties, and applications of nanophase materials, 20:21559 (R;US)
Technical analysis of the 1994 HEV challenge, 20:21529 (R;US)
Testing hybrid electric vehicle emissions and fuel economy at the 1994 Hybrid Electric Vehicle Challenge, 20:21530 (R;US)
The Argonne Wakefield Accelerator high current photocathode, gun and drive linac, 20:21940 (R;US)
The Chemical Technology Division at Argonne National Laboratory: Applying chemical innovation to environmental problems, 20:21379 (R;US)
The choice: Welding with CO_2 or Nd:YAG lasers, 20:21489 (R;US)
The development of a bench scale metal distillation furnace (retort), 20:20734 (R;US)
The effect of displacement cascades on small helium bubbles in aluminum and gold, 20:21562 (R;US)
The effects of the glass surface area/solution volume ratio on glass corrosion: A critical review, 20:20746 (R;US)
The elliptical multipole wiggler project, 20:21942 (R;US)
The interaction of vortices with twin boundaries, 20:22820 (R;US)
The MINPACK-2 test problem collection, 20:22913 (R;US)

The nature and fate of natural resins in the geosphere VI. Analysis of fossil resins from Axel Heiberg Island Canadian Arctic, 20:21677 (R;US)
The probability of containment failure by direct containment heating in surry, 20:21315 (R;US)
The Tracking and Analysis Framework (TAF): A tool for the integrated assessment of acid deposition, 20:22152 (R;US)
Theoretical dynamical studies of metal clusters and cluster-ligand systems, 20:21698 (R;US)
Thermal oxidation vitrification flue gas elimination system, 20:20752 (R;US)
Transient and steady-state erosion of in-situ reinforced silicon nitride, 20:21607 (R;US)
Uptake of explosives from contaminated soil by existing vegetation at the Iowa Army Ammunition Plant, 20:22330 (R;US)
US Air Force Materiel Command's second round ECAMP results, 20:21346 (R;US)
Users guide to the Argonne SP scheduling system, 20:22914 (R;US)
Users manual for doctext: Producing documentation from C source code, 20:22915 (R;US)
Using remotely sensed planetary boundary layer variables as estimates of areally averaged heat flux, 20:22157 (R;US)
Utilization of surface-treated rubber particles from waste tires, 20:21488 (R;US)
Vitrification of low-level radioactive mixed waste at Argonne National Laboratory, 20:20753 (R;US)
Waste minimization in analytical methods, 20:20748 (R;US)
Wavelet analysis of atmospheric turbulence structures: What can we gain from this new technique?, 20:22156 (R;US)
XUV postionization of fragments of photodissociated C_{60}, 20:21638 (R;US)
Yucca Mountain Project - Argonne National Laboratory annual progress report, FY 1994, 20:20747 (R;US)

Arizona Univ., Tucson, AZ (United States). Dept. of Physics
Unusual behavior in the magnetic anisotropy of ultra-thin Co Sandwiches: The role of underlayers, 20:21650 (R;US)

Arizona Univ., Tucson, AZ (United States). Engineering Experiment Station
Discrete modeling of optical pulse propagation in nonlinear media. Final report, 20:21845 (R;US)

Arkansas Univ., Little Rock, AR (United States)
Electrostatic beneficiation of coal, 20:20525 (R;US)

Army Engineer Waterways Experiment Station, Vicksburg, MS (United States). Structures Lab.
Grout for closure of the demonstration vault at the US DOE Hanford Facility. Final report, 20:20781 (R;US)

Army Environmental Center, Aberdeen Proving Ground, MD (United States)
Uptake of explosives from contaminated soil by existing vegetation at the Iowa Army Ammunition Plant, 20:22330 (R;US)

Army Test and Evaluation Command, Dugway, UT (United States)
RCRA delisting of agent-decontaminated waste at Dugway Proving Ground, 20:22149 (R;US)

Aspen Technology, Inc., Cambridge, MA (United States)
Engineering design and analysis of advanced physical fine coal cleaning technologies. Final report, 20:20528 (R;US)

Association Euratom-CEA, Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee
Theory and experiments on RF plasma heating, current drive and profile control in TORE SUPRA, 20:22849 (R;FR)

Atomic Energy Establishment, Cairo (Egypt)
The role of governmental and non-governmental organizations in developing and teaching radiation physics, 20:21060 (I;EG)

Auburn Univ., AL (United States). Dept. of Chemical Engineering
Configurational diffusion of asphaltenes in fresh and aged catalyst extrudates. Quarterly progress report, December 20, 1994–March 20, 1995, 20:20559 (R;US)
Role of the resid solvent in catalytic coprocessing with finely divided catalysts. Quarterly report, January–March 1995, 20:20558 (R;US)

B

Babcock and Wilcox Co., Alliance, OH (United States). Research and Development Div.
Development of a prototype lignin concentration sensor. Final report, 20:21074 (R;US)
Lightguide-coupled sensor for in-situ radiation monitoring, 20:22271 (R;US)

Babcock and Wilcox Co., New Orleans, LA (United States)
Engineering development of advanced froth flotation. Volume 2, Final report, 20:20526 (R;US)
Engineering development of advanced physical fine coal cleaning technologies: Froth flotation. Quarterly technical progress report No. 25, October 1, 1994–December 31, 1994, 20:20527 (R;US)

Battelle Pacific Northwest Lab., Richland, WA (United States)
234-5 Building design philosophy, 20:21732 (R;US)

Battelle, Columbus, OH (United States)
Characterization of air toxics from a laboratory coal-fired combustor and utility scale power plants. Quarterly progress report No. 14, January–March, 1995, 20:21164 (R;US)

Battelle-Northwest, Richland, WA (United States). Pacific Northwest Lab.
Preliminary project proposal for process area ventilation modifications 231-Z Building. Revision 1, 20:20735 (R;US)

Bayernwerk AG, Muenchen (Germany)
Bayernwerk AG. 74th annual report, 1 October 1993 through 30 September 1994, 20:21428 (I;DE;In German)

BDM Oklahoma, Inc., Bartlesville, OK (United States)
An evaluation of the benefits of combined steam and fireflooding as a recovery process for heavy oils, 20:20638 (RA;US)
Comprehensive kinetic models for the aquathermolysis of heavy oils, 20:20637 (RA;US)
DOE cost-shared in situ combustion projects revisited, 20:20633 (RA;US)
Enhanced oil recovery using hydrogen peroxide injection, 20:20643 (RA;US)
Improved sweep efficiency through the application of horizontal well technology in a mature combustion EOR project: Battrum Field, Saskatchewan, Canada, 20:20640 (RA;US)
In situ combustion - from pilot to commercial application, 20:20632 (RA;US)
In situ combustion field experiences in Venezuela, 20:20634 (RA;US)
Koch's experience with deep in situ combustion in Williston basin, 20:20644 (RA;US)
Naval Petroleum Reserve No. 3 (NPR-3), Teapot Dome Field, Wyoming: Case history of the in situ combustion pilot operation, 20:20642 (RA;US)
Oxygen enriched fireflooding, 20:20631 (RA;US)
Redeeming features of in situ combustion, 20:20630 (RA;US)
Romania - 30 years of experience in in situ combustion, 20:20635 (RA;US)
Shallow oil production using horizontal wells with enhanced oil recovery techniques, 20:20641 (RA;US)
The effect of low-temperature oxidation on the fuel and produced oil during in situ combustion, 20:20636 (RA;US)
The use of air injection to improve the double displacement processes, 20:20639 (RA;US)

Bechtel Hanford, Inc., Richland, WA (United States)
Radioactive air emissions program notice of construction for the decommissioning of the 233-S Plutonium Concentration Facility Complex. Revision 1, 20:21014 (R;US)

Bechtel National, Inc., Oak Ridge, TN (United States)
Remedial investigation report on Waste Area Group 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 1: Technical summary, 20:21009 (R;US)
Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 2, Appendix A: Characterization methods and data summary, 20:21010 (R;US)
Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 3, Appendix B, Technical findings and conclusions, 20:21011 (R;US)

Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 4: Appendix C, Risk assessment, 20:21012 (R;US)
Site characterization report for the Old Hydrofracture Facility at Oak Ridge National Laboratory, Oak Ridge, Tennessee, 20:21019 (R;US)
Site characterization summary report for Waste Area Grouping 10 Wells at the Old Hydrofracture Facility, Oak Ridge National Laboratory, Oak Ridge, Tennessee, 20:20809 (R;US)

Bechtel National, Inc., Richland, WA (United States)
Baseline design/economics for advanced Fischer-Tropsch technology. Quarterly report, July–September 1994, 20:20542 (R;US)

Bettis Atomic Power Lab., West Mifflin, PA (United States)
Piping elbow irrecoverable pressure loss coefficients for moderately high Reynolds numbers, 20:21819 (R;US)

Blake (F.H.) and Associates, Mill Creek, CA (United States)
Fiber-optic, anti-cycling, high pressure sodium street light control. Final technical progress report, 20:21455 (R;US)

Boston Univ., MA (United States). Dept. of Physics
The heavy electron state. Final report, February 1, 1991–August 31, 1994, 20:21649 (R;US)

Bridgeport Brass Co., Adrian, MI (United States)
Extrusion of I&E "O" size tubing to finalize the process. Experiment No. U-31, 20:21583 (R;US)

Brigham Young Univ., Provo, UT (United States)
Investigation of mineral transformations and ash deposition during staged combustion. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:20594 (R;US)

Brookhaven National Lab., Upton, NY (United States)
A laser system for the TESLA photo-injector, 20:21954 (RA;US)
A low emittance lattice for the NSLS X-Ray Ring, 20:21959 (R;US)
A probabilistic model to liquefaction assessment of dams, 20:22498 (R;US)
A superconducting linear motor drive for a positive displacement bellows pump for use in the g-2 cryogenics system, 20:22098 (R;US)
A systems approach to risk assessment: Application to methylmercury from coal combustion, 20:20598 (R;US)
Advanced Neutron Source enrichment study – Volume 1: Main report. Final report, Revision 12/94, 20:21259 (R;US)
Advanced Neutron Source enrichment study. Volume 2: Appendices – Final report, Revision 12/94, 20:21260 (R;US)
Aging mechanisms for concrete components of High-Level Waste storage tanks, 20:20767 (R;US)
An overview of the DOE high-level waste storage tank structural integrity assessment guidelines, 20:20766 (R;US)
BBAT: Bunch and bucket analysis tool, 20:21895 (R;US)
Beam dynamics group summary, 20:21898 (R;US)
Combined element magnet production for the relativistic heavy ion collider (RHIC) at BNL, 20:21957 (R;US)
Comparison of seasonal and zonal patterns of the direct and indirect radiative forcing of climate by aerosols, 20:22161 (R;US)
Construction and testing of arc dipoles and quadrupoles for the relativistic heavy ion collider (RHIC) at BNL, 20:22054 (R;US)
Convolution-deconvolution in DIGES, 20:22499 (R;US)
Damping rates of the SRRC storage ring, 20:21899 (R;US)
Design, simulation and visualization of ultrafast electron optical devices, 20:21893 (RA;US)
Diode-pumped lasers and amplifiers for photocathode illumination, 20:21950 (RA;US)
Drive lasers and photocathodes for the advanced free electron laser project, 20:21947 (RA;US)
Electro symmetry breaking and beyond the standard model, 20:22561 (R;US)
Enhanced shortwave cloud radiative forcing due to anthropogenic aerosols, 20:22164 (R;US)
Evaluation of single failure effects during loss of coolant accidents for a VVER-440 reactor, 20:21292 (R;US)
Field quality control through the production phase of RHIC arc dipoles, 20:21956 (R;US)
Gigahertz repetition rate AlGaAs/Ti:Sapphire (LiSAF) modelocked oscillator/power amplifier laser system for advanced photoinjectors, 20:21945 (RA;US)
Hadron distributions at higher rapidity using the BRAHMS forward spectrometer, 20:22692 (R;US)
Impact of reduced dose limits on NRC licensed activities. Major issues in the implementation of ICRP/NCRP dose limit recommendations: Final report, 20:22463 (R;US)
Inelastic cross sections for positron scattering from atomic hydrogen, 20:22774 (R;US)
INFCIRC/153 as the basis for verification of a special nuclear materials production cutoff convention, 20:21047 (R;US)
Issues in the assessment of congenital health risks from mercury in coal, 20:21168 (R;US)
Laser requirements for RF guns, 20:21952 (RA;US)
Lasers for RF guns: Capabilities of lasers, present and future, 20:21944 (RA;US)
Mitigation options for accidental releases of hazardous gases, 20:22163 (R;US)
Mixing phenomena of interest to boron dilution during small break LOCAs in PWRs, 20:21293 (R;US)
Multiple-linac approach for tritium production and other applications, 20:20729 (R;US)
Numerical studies of Siberian snakes and spin rotators for RHIC, 20:21894 (R;US)
Overview of rare K decays, 20:22579 (R;US)
Overview of research and development in subsurface fate and transport modeling, 20:20765 (R;US)
Performance of the SRRC storage ring and wiggler commissioning, 20:22055 (R;US)
Phenomenology of crystalline beams in smooth accelerators, 20:21897 (R;US)
Picosecond laser source with single knob adjustable pulse width, 20:21951 (RA;US)
Rebucketing after transition in RHIC, 20:21896 (R;US)
Recent results from E866, 20:22693 (R;US)
Release of radon contaminants from Yucca Mountain: The role of buoyancy driven flow, 20:20764 (R;US)
Reliability, CO_2 concentration control, and CO_2 gas use of the FACE facility at ETH in 1993 and 1994, 20:22162 (R;US)
Report of the working group on laser systems, 20:21953 (RA;US)
Research programs at the Department of Energy National Laboratories. Volume 2: Laboratory matrix, 20:21391 (R;US)
RF photoinjectors: A guide to performance requirements and demands on laser systems, 20:21943 (RA;US)
Safety assessment and surveillance of decommissioning operations at DOE's nuclear facilities, 20:22400 (R;US)
Scaling between K^+ and proton production in nucleus-nucleus collisions, 20:22691 (R;US)
Small-gap undulator experiment on the NSLS X-ray Ring, 20:21960 (R;US)
SSC 17-meter dipole magnet DD000Z test results and investigation of coil failure: The report of the "Z" Committee, 20:22052 (R;US)
Summer Research Internship Program (FY94) Brookhaven National Laboratory, 20:22916 (R;US)
Superconducting 8 CM Corrector magnets for the relativistic heavy ion collider (RHIC), 20:21958 (R;US)
Superconducting sextupoles and trim quadrupoles for RHIC, 20:21955 (R;US)
The Brookhaven Accelerator Test Facility Nd:YAG laser, 20:21949 (RA;US)
The Brookhaven muon g-2 experiment, 20:22646 (R;US)
The High Flux Beam Reactor at Brookhaven National Laboratory, 20:21261 (R;US)
The measurement of nuclear medium effects with K^+, 20:22695 (R;US)
The RHIC status update, 20:21859 (R;US)
The SLAC polarized electron source laser system, 20:21948 (RA;US)
The synchro laser system for the CLIC Test Facility, 20:21946 (RA;US)
The U.S. Nuclear Data Network: Summary of the twentieth meeting, 20:22970 (R;US)
To VMD, or not to VMD, in the quark-gluon plasma, 20:22562 (R;US)
Traffic congestion forecasting model for the INFORM System. Final report, 20:21480 (R;US)

Twenty-second water reactor safety information meeting: Proceedings. Volume 1: Plenary session; Advanced instrumentation and control hardware and software; Human factors research; IPE and PRA, 20:21313 (R;US)

Twenty-second water reactor safety information meeting: Proceedings. Volume 3: Primary systems integrity; Structural and seismic engineering; Aging research, products and applications, 20:21314 (R;US)

USDOE study: Human health and ecological risk assessment for produced water discharges, 20:20648 (R;US)

Waste reduction options for manufacturers of copper indium diselenide photovoltaic cells, 20:21113 (R;US)

Burns and Roe Utility Management Consultants, Gales Ferry, CT (United States)

Los Alamos National Laboratory Omega West Reactor restart, 20:21289 (R;US)

Gesellschaft fuer Anlagen- und Reaktorsicherheit (GRS) mbH, Koeln (Gemany)
Reports on research programs in the field of reactor safety sponsored by the Federal Ministry of Research and Technology. Reported period: January 1 to June 30, 1994, 20:21309 (I;DE;In German)

Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen, Neuherberg (Germany). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU)
Capacity for oxidative and reductive detoxification of NO_x and SO_2 and for neutralisation of acid in leaves and needles of forest trees. Final report, 20:22475 (R;DE;In German)

Giessen Univ. (Germany). Inst. fuer Pflanzenoekologie
Ozone effects on plants. Evaluation of ozone profiles measured in Hessen, 20:22479 (R;DE;In German)

Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.
Accelerator complex with low-energy mixed electron-proton beams, 20:21861 (R;RU;In Russian)
Analysis of threshold anomaly in elastic and inelastic proton scattering, 20:22702 (R;RU;In Russian)
Application of optical potential theory for calculation of nucleon cross sections, 20:22700 (R;RU;In Russian)
Consideration of the application of $D_2O:Eu^{3+}:UO_2^{2+}$ liquid as an active medium for nuclear pumped lasers, 20:21718 (R;RU;In Russian)
Effect of nuclear friction on the electromagnetic decay of collective vibrational states of heated spherical nuclei, 20:22682 (R;RU;In Russian)
Effect of nuclear level density on the calculation of excitation function for production of cesium, xenon, iodine, thallium, lead and bismuth radionuclides, 20:22701 (R;RU;In Russian)
Fluctuating spectroscopy of boron nitride graphite-like materials, 20:21652 (R;RU;In Russian)
Focusing of ion beam with limit emittance by accelerator tube of electrostatic accelerator, 20:21860 (R;RU;In Russian)
Measurement of β_{eff} and neutron lifetime in fast critical assemblies for transition from BNAB-78 constant system to BNAB-90 one, 20:21220 (R;RU;In Russian)
Measurement of radiation multiplicity spectra and alpha value for uranium-235, 20:22074 (R;RU;In Russian)
Metal-insulator phase transitions in the systems with dipole-dipole interaction, 20:21620 (R;RU;In Russian)
Nitrogen effect on crystal lattice dynamics in austenitic steel type Kh18AG19, 20:21578 (R;RU;In Russian)
Numerical investigation of flows and heat exchange in tubes with use of (k-ε) turbulence model, 20:21799 (R;RU;In Russian)
On the structure of molecular dynamic model of liquid potassium, 20:21580 (R;RU;In Russian)
Possibilities of improvement of the DIN-2K spectrometric complex performances, 20:22073 (R;RU;In Russian)
Problems of synthesis and generating properties of uranium containing inorganic liquid on the basis of phosphorus oxychloride activated with neodymium, 20:21717 (R;RU;In Russian)
Study of oxygen influence on sodium surface tension, 20:21579 (R;RU;In Russian)
Subthreshold diagnostics and features of uranium-containing laser-active liquid on the basis of sulfuryl, 20:21719 (R;RU;In Russian)
The influence of the water chemistry regime of the third circuit on the corrosion hydrogen burden to the secondary sodium circuit in the steam generator model of BN-800 reactor, 20:21195 (R;RU;In Russian)
Theoretical and numerical analysis of the thermionic converter idle regime, 20:22843 (R;RU;In Russian)

Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij
Analysing power measurements in elastic proton-proton scattering at 24 and future measurements at 400 GeV, 20:22607 (IA;RU)
Antinucleon-nucleon and nucleon-nucleon total cross sections and elastic scattering observables at all energies, 20:22606 (IA;RU)
Code spin Lie - the code for calculation of polarization in collider using Lie operators method, 20:21906 (IA;RU)
Comparison of spin asymmetries and cross sections in π^0 production by 200-GeV polarized antiprotons and protons, 20:22604 (IA;RU)
Computerized simulation of spin rotation effect of relativistic particles by a bent crystal, 20:22798 (IA;RU;In Russian)
Elastic and inelastic electron scattering on polarized deuterons, 20:22712 (IA;RU;In Russian)
Elastic p-^{4}He scattering at intermediate energies, 20:22710 (IA;RU)
Electron paramagnetic resonance spectra of lithium-6 deuteride exposed to ultraviolet radiation and gas discharge plasma, 20:22789 (IA;RU)
Experimental study of gluon polarization at UNK. (Physical project of the first stage of POLEX programme), 20:22649 (IA;RU;In Russian)
Experimental study of polarization in Japan, 20:22688 (IA;RU)
First results for the two-spin parameters A_{LL} in π^0 production by 200 GeV polarized protons and antiprotons, 20:22605 (IA;RU)
High-X_1 single-spin asymmetry in π^0 and η production at X_F=0 by 200-GeV polarized antiprotons and protons, 20:22602 (IA;RU)
Higher-twist subprocess and helicity asymmetry A_{LL} for the reactions H_1H_2->IMX, 20:22601 (IA;RU)
Higher-twist subprocess contributions to dilepton production, 20:22600 (IA;RU)
IV. Workshop on High Energy Spin Physics, 20:22590 (I;RU;In Russian, English)
Large-X_F spin asymmetry in π^0 production by 200-GeV polarized protons, 20:22603 (IA;RU)
Longitudinal polarization studies for VEPP-4M, 20:22057 (IA;RU)
Lowest-order processes in polarized e^+e^-, $e\gamma$, $\gamma\gamma$ collisions with W,Z production, 20:22599 (IA;RU)
Measuring the gluon polarization from Drell-Yan reactions at large transverse momentum, 20:22593 (IA;RU)
Mechanism of the ^{2}He breakup by linearly polarized photons, 20:22709 (IA;RU)
On new possibilities of polarization experiments in proton beams, 20:21974 (IA;RU;In Russian)
On polarization effects in crystals, 20:22515 (IA;RU;In Russian)
On possibility of observation of anomalous magnetic moment of electrons (positrons) in crystals, 20:22569 (IA;RU;In Russian)
Orbiting quarks in polarized protons, 20:22651 (IA;RU)
Polarization γ-quanta spectrum after π^0-meson decay and channeling in oriented tungsten monocrystals, 20:22797 (IA;RU)
Polarization effects in diffractive disintegration of relativistic deuterons, 20:22703 (IA;RU)
Polarization experiments (review), 20:22591 (IA;RU)

Polarization study of the deuteron photodisintegration reaction in the δ(1232)-resonance region, 20:22707 (IA;RU)
Polarized beam in storage rings and high precision measurements of particle masses, 20:22653 (IA;RU)
Preliminary results on the first observation of channeled sigma-hyperon spin precession in bent crystals, 20:22796 (IA;RU)
Problems of using polarization effects in e,γ interactions with monocrystals in spin high-energy physics, 20:21907 (IA;RU;In Russian)
Quark-sea contribution to spin effects at high energies, 20:22594 (IA;RU)
Rotation and spin oscillation of high-energy particles in target with polarized nuclei and possibility of measurement of spin-dependent part amplitude of coherent elastic forward scattering, 20:22704 (IA;RU;In Russian)
Saturne II polarized target, 20:21970 (IA;RU)
Single spin asymmetry in inclusive meson production: What can learn from the high-energy large-X_F data?, 20:22592 (IA;RU)
Single-spin asymmetry in π+0 production by polarized antiprotons and protons, 20:22597 (IA;RU)
Snake for POLEX, 20:21975 (IA;RU)
Spin effects in rho-meson production at intermediate energies, 20:22609 (IA;RU)
Spin effects in the elastic scattering of nucleons and new approach to problems of spin structure of hadrons, 20:22598 (IA;RU)
Status of the Kharkov linac polarized electron source, 20:21973 (IA;RU)
Structure functions of sea quarks, Kogut-Susskind pole and dynamics of pp- and pp-interactions at high energies, 20:22595 (IA;RU)
Studies on polarization phenomena in the deuteron electrodisintegration, 20:22708 (IA;RU)
Supercritical pomerons and spin in pp-scattering, 20:22596 (IA;RU)
Testing proton spin models with polarized beams, 20:22652 (IA;RU)
The hydrogen and deuterium atomic beam polarized source as an internal target for NEPTUN experiment, 20:21971 (IA;RU)
The measurement of the spin rotation parameters R and A in πp elastic scattering in the energy region (1-2) motivation and experiment states, 20:22608 (IA;RU)
The p_+-dependence of asymmetry in inclusive π^0-production in the beam fragmentation region at 40 GeV, 20:22705 (IA;RU)
The possible method of beam polarization measurement on high energy electron-positron linear colliders, 20:22081 (IA;RU)
The prospect of experimental study an analysing power of polarized proton scattering on carbon, 20:22711 (IA;RU)
The target polarization measurement system with a phase shift detectors A-meter, 20:22080 (IA;RU)
The vector analyzing power 1 T_M in the π^+d->pp reaction in the energy region 350-450 MeV, 20:22706 (IA;RU)
Theoretical interpretation of polarized leptoproduction data, 20:22650 (IA;RU)
Ultracold source prototype for polarized atomic hydrogen beam (ATOM-H), 20:21972 (IA;RU)

GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU)

A measuring system for the continuous determination of the filter effect of a canopy roof on aerosol particles, 20:22192 (IA;DE;In German)
A method for quantifying the most important mechanisms of acid buffering in carbonate-free soils, 20:22304 (IA;DE;In German)
Acid rain and resulting chemical composition of soils, 20:22291 (IA;DE;In German)
Air pollutant transport with special regard to chemical transformation in heavily structured areas, 20:22182 (IA;DE;In German)
An attempt to explain the spring maximum sulphur concentrations in rainwater, 20:22189 (IA;DE;In German)
An overview of wet deposition of atmospheric trace pollutants in the Eastern Alpine region, 20:22283 (IA;DE;In German)
Atmospheric carry-over of N and absorption of N in spruce stands of Northern Bavaria, 20:22481 (IA;DE;In German)
Atmospheric deposition in the Erzgebirge, Czech Republic, 20:22300 (IA;DE;In German)
Carry-over and carry-out of pollutants in the spruce ecosystem Wank (Kalkalpen) and assessment of their importance for soil and nutrition, 20:22296 (IA;DE;In German)
Carry-over and dynaymics of pollutants in two small catchment areas in Flysch (Tegernsee Alps), 20:22289 (IA;DE;In German)
Carry-over and turnover of N in forest ecosystems of the Black Forest, 20:22295 (IA;DE;In German)
Carry-over balances of dry and wet deposition in protected forests of the Swiss alpine region along the Gotthard-transect, 20:22284 (IA;DE;In German)
Carry-over from clouds through riming of snow crystals. Contribution to ALPTRAC Project P1a, 20:22188 (IA;DE;In German)
Carry-over of ecologically hazardous substances through wet deposition in the Bavarian Northern Alps, 20:22173 (IA;DE;In German)
Carry-over of lead in the forest soils of northern and western Croatia, 20:22279 (IA;DE;In German)
Carry-over of plant protection agents through wet deposition on the Kleine Feldberg/Taunus, 20:22186 (IA;DE;In German)
Carry-over of trace pollutants through fog on forests, 20:22176 (IA;DE;In German)
Changes in growth of spruce stands in Southern Bavaria, 20:22482 (IA;DE;In German)
Changing conditions of soils influences by beech trunk runoff in Slovakia, 20:22290 (IA;DE;In German)
Chemism of wet deposition in the Italian Alps, 20:22280 (IA;DE;In German)
Concentrations of minerals in ombrogenous peat bog lays as an indicator of recent and past deposition, 20:22301 (IA;DE;In German)
Critical Loads for forest soils in Middle Europe, 20:22297 (IA;DE;In German)
Deposition of elements in forests and chemical composition of the forest soil in Southern Bohemia, 20:22303 (IA;DE;In German)
Deposition of particle/bound substances during radiation fog events, 20:22193 (IA;DE;In German)
Dry deposition in the Ziller valley, 20:22178 (IA;DE;In German)
Ecosystem management and/or forest management, 20:21358 (IA;DE;In German)
Ecosystem studies in the Kalkalpine Alpine region - altitude profile Achenkirch, 20:22298 (IA;DE;In German)
Effect-related air quality analyses at an Alpine location, 20:22187 (IA;DE;In German)
Effects of nitrogen deposition on nitrate contents in the ground water of forested catchment areas of Bavaria, 20:22347 (IA;DE;In German)
Experimental studies on increased carry-over of nitrogen in forest soils of the pre-Alpine region (Hoeglwald), 20:22346 (IA;DE;In German)
Factors influencing carry-over and carry-out of nitrogen in forest ecosystems, selected examples from sites in the Spessart, Fichtelgebirge and Munich gravel plains, 20:22348 (IA;DE;In German)
Forest damage stocktaking in Venetia, 20:22485 (IA;DE;In German)
Forest soil inventory in Hungary, 20:22288 (IA;DE;In German)
Growth of pollution and deposition during fogs, 20:22177 (IA;DE;In German)
Influence of gaseous pollutants on the biosynthesis of plant cuticles and their impact on transport properties. Final report, 20:22478 (R;DE;In German)
Investigations of geochemical processes in oak stands, with particular regard to the deposition of atmospheric pollutants, 20:22299 (IA;DE;In German)
Long-distance transport of air pollution in Central Europe, 20:22179 (IA;DE;In German)
Long-term monitoring of polluted forest ecosystems in Bavaria forest climate stations, 20:22174 (IA;DE;In German)
Measuring deposition in the forests of western Hungary, 20:22282 (IA;DE;In German)
Measuring O_3 and cosmogenic BE-7 in the Central Alps, 20:22194 (IA;DE;In German)
Measuring wet deposition in alpine high elevation sites, 20:22278 (IA;DE;In German)
Mineral content of ombrogenous peat bogs as an indicator of recent and past deposition, 20:22487 (IA;DE;In German)

Mineral nutrition and soil status in spruce forest ecosystems in the Bohemian forest in Upper Austria, 20:22293 (IA;DE;In German)
Mosses as bioindicators: the ecology of elements, 20:22490 (IA;DE;In German)
Nitrogen carry-over in mountaineous peatland, 20:22483 (IA;DE;In German)
Nitrogen carry-over in Swiss forest ecosystems and their importance for the nutritional status, 20:22294 (IA;DE;In German)
On the development of immission and deposition of air pollutants in Southern Saxony, 20:22190 (IA;DE;In German)
Ozone-pollution: a reason for needle loss of spruces in the higher altitudes of the Kalkalpen?, 20:22489 (IA;DE;In German)
Parametrisation of washout of aerosoles by means of field experiments with fluorescent-traceraerosole, 20:22185 (IA;DE;In German)
Plant protection in the forests of the State forest (results of 1992, reference: 1990 Study), 20:22486 (IA;DE;In German)
Pollutant carry-over and state of the soil in the forests of Baden-Wuerttemberg, 20:22281 (IA;DE;In German)
Pollution of forest ecosystems through deposition of sulphur, nitrogen and fluorine, 20:22292 (IA;DE;In German)
Regional estimation models for carry-over of pollutants and forest soil pollution in Southeastern Bavaria, 20:22302 (IA;DE;In German)
Research concepts on environmental precaution measures in the forest areas of Bavaria, 20:21359 (IA;DE;In German)
Results of a forest soil inventory in Southern Tyrol, 20:22287 (IA;DE;In German)
Results of a pilot study on a Swiss forest soil inventory, 20:22286 (IA;DE;In German)
Results of immission measuring flights across the Alps, 20:22180 (IA;DE;In German)
Results of sulphur and nitrogen measurements in samples of the Austrian bio-indicator network, 20:22480 (IA;DE;In German)
Results of the Austrian inventory of the state of forest soils, 20:22285 (IA;DE;In German)
Results of the POLLUMET-measuring campaigns and other research flights in the Alpine regions conducted to study air pollution, 20:22181 (IA;DE;In German)
Strategies for an Intelligent Protection of the Alps - Scientific information in politics, 20:21356 (IA;DE;In German)
The bioindication of sulphur in the Republic of Slowenia, 20:22488 (IA;DE;In German)
The concept of the project "Leermoos/Loichtal case study" as part of the research campaing against forest death, 20:22184 (IA;DE;In German)
The contribution of environmental protection- and forest protection laws on reduction of forest soil pollution in Switzerland, 20:21357 (IA;DE;In German)
The deposition measuring grid in Bavaria - a comparison of total deposition and wet deposition in agriculturally used areas, pastures and forests, 20:22191 (IA;DE;In German)
The role of carry-over, climate and soil in the oak deaths in Hungary, 20:22183 (IA;DE;In German)
The synergism between SO_2 oxidation and manganese leaching on spruce needles - a chamber experiment, 20:22484 (IA;DE;In German)
Wet deposition in alpine forest areas, 20:22175 (IA;DE;In German)
Wet deposition in Slovenia from 1980-1992, 20:22172 (IA;DE;In German)

Application of the HGSYSTEM/UF_6 model to simulate atmospheric dispersion of UF_6 releases from uranium enrichment plants, 20:20980 (R;US)
Environmental monitoring and surveillance on the Oak Ridge Reservation: 1993 Data, 20:20979 (R;US)
Evaluation of gas-phase technetium decontamination and safety related experiments during FY 1994. A report of work in progress, 20:22456 (R;US)

Oak Ridge National Lab., TN (United States)

A background subtraction routine for enhancing energy-filtered plasmon images of $MgAl_2O_4$ implanted with Al^+ and Mg^+ ions, 20:21647 (R;US)

A characterization of check valve degradation and failure experience in the nuclear power industry: 1984-1990. Volume 1, 20:21230 (R;US)

A multilevel voltage-source converter system with balanced dc voltages, 20:21831 (R;US)

A systematic ALCHEMI study of Fe-doped NiAl alloys, 20:21572 (R;US)

Actual vs anticipated savings from DSM programs: An assessment of the California experience, 20:21423 (R;US)

Al_2O_3/CeO_2 Washcoats for three-way automotive emission catalysts, 20:21534 (R;US)

Alignment of DNA and protein sequences containing frameshift errors, 20:22361 (R;US)

An interim report on shallow-flaw fracture technology development, 20:21224 (R;US)

An object oriented design for high performance linear algebra on distributed memory architectures, 20:22920 (R;US)

Applying DSM evaluation results to utility planning, 20:21424 (R;US)

Assurances associated with Monte Carlo code results, 20:22926 (R;US)

Bioenergy: What's in it for the grower? The cost of producing dedicated energy crops. Comparisons with conventional crops, 20:21072 (R;US)

Carbon dioxide Information Analysis Center and World Data Center: A for Atmospheric trace gases. Annual progress report, FY 1994, 20:22238 (R;US)

Cathode limited charge transport and performance of thin-film rechargeable lithium batteries, 20:21330 (R;US)

Cementitious stabilization of chromium, arsenic, and selenium in a cooling tower sludge, 20:20773 (R;US)

Chemical oxidation of volatile and semi-volatile organic compounds in soil, 20:20774 (R;US)

Chemometrics review for chemical sensor development, task 7 report, 20:20780 (R;US)

Continental scale estimastes of the biotic carbon flux from land cover change: 1850 to 1980, 20:22322 (R;US)

Cost results from the 1994 Fernald characterization field demonstration for uranium-contaminated soils, 20:21020 (R;US)

Data summary report for fission product release Test VI-7, 20:21256 (R;US)

Defect formation and carrier doping in epitaxial films of the "parent" compound $SrCuO_2$: Synthesis of two superconductors descendants, 20:21616 (R;US)

Design and testing of integrated circuits for reactor protection channels, 20:21236 (R;US)

Development of a comprehensive environmental technologies list for the U.S. Department of Energy, 20:21349 (R;US)

Drosophila GRAIL: An intelligent system for gene recognition in Drosophila DNA sequences, 20:22358 (R;US)

Effect of the colony microstructure on transport critical current of high-J_c Tl-1223 thick films, 20:21617 (R;US)

Embrittlement of austenitic stainless steel welds, 20:21569 (R;US)

Enhanced code for the full space parameterization approach to solving underspecified systems of algebraic equations: Version 1.0, 20:21764 (R;US)

Environmental monitoring and surveillance on the Oak Ridge Reservation: 1993 Data, 20:20979 (R;US)

Enzymatic production of hydrogen from glucose, 20:21067 (R;US)

Evaluation of improved techniques for the removal of ^{90}Sr and ^{137}Cs from process wastewater and groundwater: Chabazite zeolite baseline study, 20:20811 (R;US)

Fabrication of optical channel waveguides in the GaAs/AlGaAs system by MeV ion beam bombardment, 20:22111 (R;US)

Final project report on arsenic biogeochemistry in the Clinch River and Watts Bar Reservoir: Volume 1, Main text. Environmental Restoration Program, 20:22351 (R;US)

Finite-volume model for chemical vapor infiltration incorporating radiant heat transfer. Interim report, 20:21627 (R;US)

Flow excursion time scales in the advanced neutron source reactor, 20:21296 (R;US)

Flow excursion time scales in the Advanced Neutron Source Reactor, 20:21262 (R;US)

Formation of artificially-layered high-temperature superconductors using pulsed-laser deposition, 20:21645 (R;US)

Fracture analysis of the NESC-1 spinning cylinder experiment, 20:21225 (R;US)

Fracture behavior of bainitic chromium-tungsten and chromium-molybdenum steels, 20:21566 (R;US)

From fire to ice, 20:21453 (R;US)

Gas pressure sintering of silicon nitride to optimize fracture toughness, 20:21615 (R;US)

Gas transport model for chemical vapor infiltration. Topical report, 20:21667 (R;US)

Heavy-Section Steel Irradiation Program: Volume 3, Progress report, October 1991–September 1992, 20:21229 (R;US)

Highly doped p-ZnTe films and quantum well structures grown by nonequilibrium pulsed laser ablation, 20:21646 (R;US)

Identification and definition of unbundled electric generation and transmission services, 20:21429 (R;US)

Ionization delocalization and ALCHEMI of B2-ordered alloys, 20:21571 (R;US)

LAPACK for distributed memory architectures: The next generation, 20:22921 (R;US)

Laser induced diffusion of ion-implanted bismuth in fused silica, 20:22794 (R;US)

Managing electronic records: A guideline, 20:22903 (R;US)

Massively parallel simulation of welding processes, 20:21821 (R;US)

Materials considerations for molten salt accelerator-based plutonium conversion systems, 20:21216 (R;US)

Measuring persistence: A literature review focusing on methodological issues, 20:21520 (R;US)

Melting, casting, and processing of nickel and iron aluminides, 20:21567 (R;US)

Modeling and simulation of pulsed laser annealing and ablation of solid materials, 20:21644 (R;US)

Monte Carlo verification of point kinetics for safety analysis of nuclear reactors, 20:21295 (R;US)

Neutron scintillators using wavelength shifting fibers, 20:22072 (R;US)

New resistor voltage grading system at the Oak Ridge National Laboratory 25URC tandem accelerator; installation and first experience, 20:21964 (R;US)

Nuclear data for criticality safety - current issues, 20:21730 (R;US)

On the expansion for surface displacement in the neighborhood of a crack tip, 20:21570 (R;US)

Optimization of the gelcasting of a silicon nitride formulation, 20:21614 (R;US)

Oxidation-resistant interfacial coatings for continuous fiber ceramic composites, 20:21643 (R;US)

Packaging- and transportation-related occurrence reports, October-December 1994, 20:20740 (R;US)

Patterns and perspectives in applied fracture mechanics, 20:21565 (R;US)

PB-BLAS: A set of parallel block basic linear algebra subprograms, 20:22924 (R;US)

QMR methods in computational fluid dynamics, 20:22925 (R;US)

R-curve behavior of whisker-reinforced ceramic composites, 20:21618 (R;US)

Reliability of lightning resistant overhead distribution lines, 20:21322 (R;US)

Remedial investigation report on Waste Area Group 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 1: Technical summary, 20:21009 (R;US)

Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 2, Appendix A: Characterization methods and data summary, 20:21010 (R;US)

Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 3, Appendix B, Technical findings and conclusions, 20:21011 (R;US)

Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 4: Appendix C, Risk assessment, 20:21012 (R;US)

Research programs at the Department of Energy National Laboratories. Volume 2: Laboratory matrix, 20:21391 (R;US)
Results of the user survey of functional requirements for the Oak Ridge Environmental Information System, 20:22972 (R;US)
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 1: Summary, 20:21760 (R;US)
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 2: Sequoyah Unit 2 Cycle 3, 20:21761 (R;US)
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 3: Surry Unit 1 Cycle 2, 20:21762 (R;US)
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 4: Three Mile Island Unit 1 Cycle 5, 20:21763 (R;US)
SCALE: A modular code system for performing standardized computer analyses for licensing evaluation. Control modules – Volume 1, Revision 4, 20:21061 (R;US)
SCALE: A modular code system for performing standardized computer analyses for licensing evaluation. Functional modules F1–F8 – Volume 2, Part 1, Revision 4, 20:21062 (R;US)
SCALE: A modular code system for performing standardized computer analyses for licensing evaluation. Functional modules F9–F16 – Volume 2, Part 2, Revision 4, 20:22954 (R;US)
SCALE: A modular code system for performing standardized computer analyses for licensing evaluation. Miscellaneous – Volume 3, Revision 4, 20:22955 (R;US)
Science and technology for a sustainable energy future: Accomplishments of the Energy Efficiency and Renewable Energy Program at Oak Ridge National Laboratory, 20:21475 (R;US)
Site characterization report for the Old Hydrofracture Facility at Oak Ridge National Laboratory, Oak Ridge, Tennessee, 20:21019 (R;US)
Site characterization summary report for Waste Area Grouping 10 Wells at the Old Hydrofracture Facility, Oak Ridge National Laboratory, Oak Ridge, Tennessee, 20:20809 (R;US)
Six- and three-hourly meteorological observations from 223 USSR stations, 20:22505 (R;US)
Static displacements of atoms in crystalline metallic solid solutions, 20:21568 (R;US)
Strategic Environmental Research and Development Project FY 1994: Assessing national remote sensing technologies for use in US Department of Energy Environmental Restoration Activities, Oak Ridge Solid Waste Storage Area 4 case study, 20:20812 (R;US)
Terrestrial mapping of the Oak Ridge Reservation: Phase 1. Environmental Restoration Program, 20:22276 (R;US)
The advantages of including professionals from different fields of study in the solution of today's water-related problems, 20:22342 (R;US)
The Center for Environmental Technology Innovative Technology Screening Process, 20:21396 (R;US)
The design of scalable software libraries for distributed memory concurrent computers, 20:22923 (R;US)

Antiactinic properties of mineralogic substate, 20:22440 (IA;RU;In Russian)
Application low dose irradiation for increase of chicken productivity, 20:22442 (IA;RU;In Russian)
Application of radiation in pharmaceutical, biotechnological and food processing industries, 20:22384 (IA;RU;In Russian)
Application of radioactive waste of Kursk NPP reactors as a gamma radiation unit for radiostimulation of seeds in agricultural practice, 20:22388 (IA;RU;In Russian)
Application of radioimmune methods in cattle-breeding, 20:22394 (IA;RU;In Russian)
Application of radioisotopes in studying genome of extremely dangerous infections stimulators, 20:22392 (IA;RU;In Russian)
Application of test of endogeneous spleen colony formation for selection of antiactinic preparations, 20:22441 (IA;RU;In Russian)
Application of various immunodulators for increasing natural resistance of calves in conditions of the contaminated areas, 20:22445 (IA;RU;In Russian)
Application of vitamins and antioxidants for decreasing mutation frequency induced by gamma radiation, 20:22424 (IA;RU;In Russian)
Best radiomutants of tomato by biochemical features and their investigation in selection, 20:22434 (IA;RU;In Russian)
Biological assessment of meat of the irradiated sheep, 20:22453 (IA;RU;In Russian)
Biological effect of ferrocyanides and their adsorbability in laboratory and industrial tests, 20:22439 (IA;RU;In Russian)
Change of respiration parameters in animals in case of radiation injuries, 20:22452 (IA;RU;In Russian)
Cytogenetic study of radioprotective effect of compounds of various chemical closes, 20:22419 (IA;RU;In Russian)
Development of new methods of Radiotherapy of neoplasms using neutron beams of the reactors, 20:22365 (IA;RU;In Russian)
Differential biotesting of radiation and chemical contaminants of the environment, 20:22307 (IA;RU;In Russian)
Effect of algin acid and its salts on the dynamics of strontium-85 and cesium-137 accumulation in rat organism, 20:22411 (IA;RU;In Russian)
Effect of chitosane of migration, proliferation and differentiation of stem cells and system of cyclic nucleotides, 20:22423 (IA;RU;In Russian)
Effect of detoxication on the state of liver of irradiated animals, 20:22427 (IA;RU;In Russian)
Effect of interleukine-1 on the recovery of wounds in case of combined radiation injury, 20:22429 (IA;RU;In Russian)

Effect of ionizing radiation and microelements on hardness of winter wheat, 20:22431 (IA;RU;In Russian)
Effect of thymogen, diethylstilberone and cystamine administration on the indexes of nonspecific resistivity, 20:22417 (IA;RU;In Russian)
Effect of vitamins A and C on the survival rate and indices of peripheral blood in immunized pigs on the background of gamma-irradiation, 20:22449 (IA;RU;In Russian)
Effects of fatty-solvent vitamins on some hormonal indices of the cattle kept on the contaminated areas, 20:22448 (IA;RU;In Russian)
Efficiency of curative effect of plasmaphoresis at early terms of acute radiation syndrome, 20:22428 (IA;RU;In Russian)
Experience of application and prospects of usage of combined radiation technologies, 20:22383 (IA;RU;In Russian)
Experimental modification of short- and long-term effect of ionizing radiation on medications, 20:22385 (IA;RU;In Russian)
Experimental substantiation of application of perfluorane in case of combined radiation injuries complicated by hemorrhage shock, 20:22420 (IA;RU;In Russian)
First gamma field in Russia: results, problem and prospects of investigation, 20:22437 (IA;RU;In Russian)
Forestry methods in technology of decreasing of radionuclide transfer on populated and agricultural areas, 20:22433 (IA;RU;In Russian)
Functional state of thyroid of chicken in case of X-irradiation of eggs, 20:22444 (IA;RU;In Russian)
Hormonal indices in cows with radionuclide injuries of the thyroid, 20:22447 (IA;RU;In Russian)
Ion exchange unit for removal of radionuclides from milk, 20:22308 (IA;RU;In Russian)
Laboratory diagnostics and specific preventive measures of viral respiratory and intestinal infections of the cattle by monovalent and associated viral and bacterial preparations in the contaminated areas, 20:22446 (IA;RU;In Russian)
Laser modification of ionizing radiation effect for the aims of selection, 20:22432 (IA;RU;In Russian)
Methods of radiation biotechnology in turkey breeding, 20:22443 (IA;RU;In Russian)
Modifying effect of radioprotective substances of B-lymphocytes dynamics in mice spleen under irradiation, 20:22421 (IA;RU;In Russian)
Morphofunctional assessment of dimethpramide effect on the cells producing biogenic amines in case of acute intestinal radiation syndrome, 20:22414 (IA;RU;In Russian)
New effective radioprotective compounds derivatives of sulfur-containing protective substances, 20:22425 (IA;RU;In Russian)
New technology of treatment of radiation injuries (theoretical substantiation, experimental research, limitations and prospects), 20:22413 (IA;RU;In Russian)
Physico-technological qualities of sheep skin following external gamma low dose irradiation of lambs, 20:22451 (IA;RU;In Russian)
Preparation of mutants of Gracila-riidal, 20:22435 (IA;RU;In Russian)
Processes of radiation biological technology for prevention of bioinjuries and corrosion of biogenic nature in oil production, 20:22455 (RA;RU;In Russian)
Protection of users of vide display terminals from electromagnetic radiation (analysis of radiation situation, recommendations on protection), 20:22410 (IA;RU;In Russian)
Protective effect of ammonium cation on development of radiation injury in plants, 20:22436 (IA;RU;In Russian)
Protective effect of nonspecific biostimulators on the animals organisms subjected to ionizing radiation, 20:22450 (IA;RU;In Russian)
Radiation biological technologies of decontamination from conditionally pathogenic bacteria and salmonellas of fodder and products of poultry plant, 20:22382 (IA;RU;In Russian)
Radiation stimulation of formation in sea buckthorn, 20:22386 (IA;RU;In Russian)
Radioimmunological analysis for immunomonitoring in routine plague of pigs, 20:22391 (IA;RU;In Russian)
Radioimmunological and radioisotope methods in cattle-breeding, 20:22393 (IA;RU;In Russian)
Radioprotective and anticarcinogenic activity of glutapyrone under chronic irradiation of mice, 20:22418 (IA;RU;In Russian)
Realization of immunological model of genesis of postradiation reactions, 20:22454 (IA;RU;In Russian)
Roentgenography method of determining latent injury of seeds and cereals, 20:22389 (IA;RU;In Russian)
Selection of risk groups of diseases on the contaminated areas using a new express method-test of P-protein determination in human blood serum, 20:22422 (IA;RU;In Russian)
Significance of radiation technology in diagnostics of bacterial infections, 20:22390 (IA;RU;In Russian)
State of superspiral DNA of lymphocytes and immunity indices of people following 5 years after the actione of factors of radiation accident, 20:22426 (IA;RU;In Russian)
Study and usage of radiation mutants of tomatoes in selection, 20:22387 (IA;RU;In Russian)
Synergetic effect of ionizing radiation and microdements on the seeds of spring wheat, 20:22430 (IA;RU;In Russian)
To the problem on radioprotective efficiency of chemical preparations, 20:22416 (IA;RU;In Russian)
Unit for milk decontamination using tseolite, 20:22438 (IA;RU;In Russian)

Natural gas imports and exports: First quarter report 1995, 20:20707 (R;US)

USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management

A comparison of low and high sulfur middle distillate fuels in the United States, 20:20679 (RA;US)

A study of the safety of the ASTM D5304 oxygen overpressure stability test, 20:20678 (RA;US)

An improved reference fuel system: Part 2 - A study of adherent and filterable insolubles formation as functions of trimethylpyrrole concentration in dodecane, 20:20666 (RA;US)

Analysis of sulfur-organic compounds in jet fuel by chromatographic sniffing and gas chromatography with atomic emission detector, 20:20690 (RA;US)

Automated deposit-measuring device (ADMD), 20:20691 (RA;US)

Automatic stability analyzer of heavy fuel oils, 20:20689 (RA;US)

Characterization of Soluble Macromolecular Oxidatively Reactive Species (SMORS) from middle distillate diesel fuels: Their origin and role in instability, 20:20680 (RA;US)

Chemistry of sediment formation and additive response in cracked middle distillates, 20:20677 (RA;US)

Compatibility and stability of residual fuels, 20:20673 (RA;US)

Effect of metal oxides and tanks' deposits on the oxidative stability of gasoline, 20:20668 (RA;US)

Evaluation of commercial stability additives in middle distillate fuels, 20:20675 (RA;US)

Gum formation tendencies of olefinic structures in gasoline and synergistic effect of sulphur compounds, 20:20671 (RA;US)

Improving storage stability of gasoline using elevated antioxidant concentrations, 20:20669 (RA;US)

Intercompatibility of residual fuel blends, 20:20672 (RA;US)

Investigation of sensitivity to microbial infection of diesel fuel at the refinery stage, 20:20692 (RA;US)

Lubricity characteristics of low sulfur, low aromatic content naval distillate fuel, 20:20685 (RA;US)

Mechanisms for ageing of middle distillates manufactured from crude oils, 20:20674 (RA;US)

Monitoring the formation of soluble deposit precursors in fuels with light scattering photometry, 20:20665 (RA;US)

Predicting stability at the refinery using SMORS, 20:20693 (RA;US)

Revised procedure for the measurement of particulate matter in Naval JP5 aviation turbine fuel (F44; AVCAT) using the contaminated fuel detector (CFD), 20:20667 (RA;US)

Stabiliser additive performance in diesel fuels and gas oils meeting new environmental targets, 20:20682 (RA;US)

Stability of light straight run diesel fuel during long term underground storage in small size steel tanks, 20:20687 (RA;US)

Storage stability of light cycle oil: Studies for the root substance of insoluble sediment formation, 20:20688 (RA;US)

The effect of aliphatic olefins on the stability of diesel fuel, 20:20676 (RA;US)

The effect of increased refining on the lubricity of diesel fuel, 20:20681 (RA;US)

The effect of some metals on the oxidative and storage stability of gasoline, 20:20670 (RA;US)

The effects of dyeing diesel fuel "blue", 20:20684 (RA;US)

The U.S. Department of Energy's Oil Processing Program, 20:20645 (RA;US)

Thermal stability of diesel fuels by quantitative gravimetric JFTOT, 20:20686 (RA;US)

Thickness measurement of JFTOT tube deposits by ellipsometry, 20:20663 (RA;US)

US diesel fuel reformulation: Additive technology in response to changing fuel properties, 20:20683 (RA;US)

Utilization of the spent caustics generated in the petroleum refineries in the crude distillation unit, 20:20646 (RA;US)

Weighing by stopwatch - sorting out the variables in filter blocking tendency, 20:20664 (RA;US)

USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of the Deputy Assistant Secretary for Advanced Research and Special Technologies

Fuel cell systems multi-year program plan, fiscal years 1995 to 2000, 20:21445 (R;US)

Energies of organic compounds, 20:21702 (R;US)

Yerevan Physics Inst., Erevan (Armenia)
Research and development to complete construction of a setup for determination of the longitudinal profile and duration of ultrashort bunches. Final report, 20:21989 (R;US)

Yerevan Research Inst. for Optical and Physical Measurement (Armenia)
Research and development to complete construction of a setup for determination of the longitudinal profile and duration of ultrashort bunches. Final report, 20:21989 (R;US)

Z

Zentrum fuer Sonnenenergie- und Wasserstoff-Forschung (ZSW), Stuttgart (Germany)
Experimentation and experimental simulation of hydrogen combustion with air and oxygen in 1kW to 2kW phosphoric acid fuel cells, 20:21449 (IA;DE)

Personal Author Index

Authors' surnames are indexed in the form appearing in the publication cited; given names generally have been reduced to initials. For documents with multiple authors, each author name is indexed. The entry for a primary author (first author listed on an abstracted document) includes the full document title and citation number. Entries for other authors provide a cross-reference to the primary author. Also included is information on the document type, country of publication, and the document language listed in parentheses in the format (J;FR;In French and English). Accent marks are not input because of computer alphabetization. Spelling and transliteration follow standard conventions.

Subject Index

This index is arranged by subject descriptors selected from those assigned to each citation in this publication. Subject descriptors are selected from a controlled thesaurus of terms, ETDE/PUB–2(Rev.1), *International Energy: Subject Thesaurus*. In order to enhance indexing, subject descriptor entries generally consist of a pair of descriptors: a main term and a qualifier term. Each entry includes the full title (which may be followed by supplementary descriptive information in parentheses) and the citation number. Additional information given in parentheses indicates the document type (an abbreviation such as B for book), the country of publication (such as DE for Federal Republic of Germany), and the language if non-English.

See references guide users from synonymous terms to the descriptors selected for the concept. *See also* references indicate subject concepts that are more specific than a particular descriptor. To gain complete subject coverage, all such terms should be reviewed.

A

URANIUM
Actinide solution processing at the Rocky Flats Environmental Technology Site, 20:20779 (R;US)
Determination of naturally-occurring actinides and their progeny in fresh water using inductively coupled plasma-mass spectrometry and batch separation, 20:22341 (R;US)

ACTINIUM 225
Experimental studies for production of some medically important radionuclides: ruthenium-97, tungsten-178, actinium-225, 20:21708 (RA;RU)
Study of α-decay in rare earth region, 20:22685 (RA;RU)

ACTINIUM ADDITIONS
See ALLOYS

ACTIVATED CARBON
Development of process combinations facilitating the commercial use of powdered active carbon in refined waste water purification through recycling of biologically regenerated, partially loaded active carbon. Final report, 20:22345 (R;DE;In German)
Potential study of an environment harmony type coal utilization system. Potential study of an environment harmony type coal utilization system in the industrial sector in China, 20:20568 (R;JP;In Japanese)

ACTUATORS
An application of mechanical leverage to microactuation, 20:21836 (R;US)
Development and production of two explosive components using SCB technology, 20:22128 (R;US)
Thin film conductive polymer for microactuator and micromuscle applications, 20:21777 (R;US)

ADHESIVES
Adhesive materials and processing selection for environmentally conscious manufacturing, 20:21498 (R;US)
Flip Chip Attach (TRP ARPA No. 3327). Quarterly report, January 1, 1995–March 31, 1995, 20:21832 (R;US)

ADL PROCESS
See COAL LIQUEFACTION

ADOLESCENTS
DOE/Project SEED student scholars partnership. Final report, June 7, 1994–April 27, 1995, 20:21339 (R;US)

ADVANCED LIGHT SOURCE
Design and performance of the ALS double-crystal monochromator, 20:21987 (R;US)
Field errors in hybrid insertion devices, 20:21988 (R;US)
New results in atomic physics at the Advanced Light Source, 20:22771 (R;US)

ADVANCED PHOTON SOURCE
A VXI-based, integrated system of beam position monitoring and rf measuremednt for the Advanced Photon Source (APS) linear accelerator, 20:21939 (R;US)
Design and test results of kicker units for the positron accumulator ring at the APS, 20:21937 (R;US)
Effects of vertical aperture on beam lifetime at the Advanced Photon Source (APS) storage ring, 20:21889 (R;US)
Magnetic measurements of the elliptical multipole wiggler prototype, 20:22053 (R;US)
Overall design concepts for the APS storage ring machine protection system, 20:21855 (R;US)
Radiation measurements at the Advanced Photon Source (APS) linear accelerator, 20:21857 (R;US)
Reduction of open-loop low frequency beam motion at the APS, 20:21891 (R;US)

AEROSOL GENERATORS
Centralized consolidation/recycling center, 20:20850 (R;US)

AEROSOL MONITORING
Comparison of temperature and humidity profiles with elastic-backscatter lidar data, 20:22198 (R;US)

AEROSOLS
See also RADIOACTIVE AEROSOLS
A measuring system for the continuous determination of the filter effect of a canopy roof on aerosol particles, 20:22192 (IA;DE;In German)
Chemistry and physics of aerosol dynamics in the atmosphere, 20:22232 (RA;NO)
Comparison of seasonal and zonal patterns of the direct and indirect radiative forcing of climate by aerosols, 20:22161 (R;US)
Implementation of Raman lidar for profiling of atmospheric water vapor and aerosols at the SGP CART site, 20:22244 (R;US)
Laboratory studies of trace gas uptake on stratospheric aerosol mimics, 20:22219 (RA;NO)
Longwave radiative forcing by aqueous aerosols, 20:22159 (R;US)

AFFIRMATIVE ACTION

In-place HEPA filter testing summary (1993), 20:20792 (R;US)
Technology development: HEPA filter service life test plan, 20:21765 (R;US)

AIR POLLUTION
Cold start analysis and the total national emission (Denmark), 20:22209 (RA;DK;In Danish)

Aerosols
Parametrisation of washout of aerosoles by means of field experiments with fluorescent-traceraerosole, 20:22185 (IA;DE;In German)

Air Pollution Abatement
The Chemical Technology Division at Argonne National Laboratory: Applying chemical innovation to environmental problems, 20:21379 (R;US)

Alarm Systems
Air pollution monitoring for on-line warning and alarm, 20:22210 (R;NO)

Alaska
NO_x, PAN, Alkyl, Nitrates, NO_y and O_3 measurements during spring in interior Alaska, 20:22221 (RA;NO)

Annual Variations
An attempt to explain the spring maximum sulphur concentrations in rainwater, 20:22189 (IA;DE;In German)

Atmospheric Chemistry
Air pollutant transport with special regard to chemical transformation in heavily structured areas, 20:22182 (IA;DE;In German)

Biological Effects
Studies at the Wank environmental monitoring base on the xanthophyll cycle as a biomonitor for stress influences of air pollutants and climate in field conditions, 20:22473 (R;DE;In German)

Biological Indicators
Examination of activity along secondary metabolic pathways in spruce and pine as possible indicators of damage symptoms in the elevation profile of Wank. Final report, 20:22477 (R;DE;In German)
Studies at the Wank environmental monitoring base on the xanthophyll cycle as a biomonitor for stress influences of air pollutants and climate in field conditions, 20:22473 (R;DE;In German)

Biological Models
Ozone effects on plants. Evaluation of ozone profiles measured in Hessen, 20:22479 (R;DE;In German)

Cereals
Ozone effects on plants. Evaluation of ozone profiles measured in Hessen, 20:22479 (R;DE;In German)

Computerized Simulation
HILATAR and FINOX, 3-dimensional grid models for regional air pollutant dispersion studies, 20:22230 (RA;NO)
Daily Variations
Effect-related air quality analyses at an Alpine location, 20:22187 (IA;DE;In German)
Environmental Effects
EUROCARE and classification of environmental aggressivity in Europe, 20:21666 (R;NO)
Forests
Final report on the research project 'Air pollution and forest damage in North-Rhine Westphalia'. Aims, results, conclusions. A balance of nine years of forest damage research in North-Rhine Westphalia, 20:22472 (R;DE;In German)
Global Aspects
Unsolved international environmental problems and their influence in Norway, 20:21364 (R;NO;In Norwegian)
Hydrocarbons
Factor analysis of NMHC and ozone measured at Birkenes in South Norway, 20:22319 (RA;NO)
Identification Systems
Environmental indicators for atmospheric supply of long-range transported heavy metals, 20:22212 (R;NO;In Norwegian)
Leaves
Influence of gaseous pollutants on the biosynthesis of plant cuticles and their impact on transport properties. Final report, 20:22478 (R;DE;In German)
Lithuania
Atmospheric deposition monitoring in Lithuania, 20:22222 (RA;NO)
Metals
Mosses as bioindicators: the ecology of elements, 20:22490 (IA;DE;In German)
Monitoring
Environmental indicators for long-range atmospheric transported heavy metals, 20:22211 (R;NO)
Norway
Long-range transported pollutants. Supplies, effects and critical loads, 20:21366 (R;NO;In Norwegian, English)
Monitoring of long-range transported air pollution and precipitation. Atmospheric supply 1992, 20:22213 (R;NO;In Norwegian)
Ozone
Ozone effects on plants. Evaluation of ozone profiles measured in Hessen, 20:22479 (R;DE;In German)
Pollutants
Characterizing toxic emissions from a coal-fired power plant demonstrating the AFGD ICCT Project and a plant utilizing a dry scrubber/baghouse system: Bailly Station Units 7 and 8 and AFGD ICCT Project. Final report. Final report, 20:21166 (R;US)
Public Health
Short-time study of the connection between air pollution and health effects in Grenland. Effects of air pollution on the humans' understanding of their own health, 20:21367 (R;NO;In Norwegian)
Sulfates
An attempt to explain the spring maximum sulphur concentrations in rainwater, 20:22189 (IA;DE;In German)
Sulfur
The case of transboundary air pollution, 20:21365 (R;NO)
Sulfur Dioxide
On the development of immission and deposition of air pollutants in Southern Saxony, 20:22190 (IA;DE;In German)
Tracer Techniques
Application of tracers in atmospheric dispersion experiments, 20:22224 (RA;NO)

AIR POLLUTION ABATEMENT
NO_x reduction by injection of natural gas above the grate, in combination with urea injection in the furnace. Introductory full-scale trial at SAYSAV's waste incineration plant in Malmoe, 20:22202 (R;DK)
Polyurethane foam without ozone depleting substances. Experience from Danish industry, 20:21665 (R;DK)
Potentials for energy saving and CO_2 reduction in Baden-Wuerttemberg. Status report, 20:21360 (I;DE;In German)
Traffic and air pollution. Investigation of catalyst effect upon particulate emission (Aalborg University Centre), 20:22205 (RA;DK;In Danish)

AIR POLLUTION CONTROL
Acid rain compliance: The need for regulatory guidance, 20:21368 (RA;US)
Analysis of utility acid rain compliance plans: A discussion of issues and methods, 20:21369 (RA;US)
Discussion paper on wholesale ratemaking considerations for sulfur dioxide emissions allowance trading, 20:21373 (RA;US)
Mobile source emission control cost-effectiveness: Issues, uncertainties, and results, 20:22160 (R;US)
Regulatory treatment of allowances and compliance costs, 20:21371 (RA;US)
The role of integrated resource planning, environmental externalities, and anticipation of future regulation in compliance planning under the Clean Air Act Amendments of 1990, 20:21370 (RA;US)
Utility regulators and the market for emission allowances, 20:21372 (RA;US)

AIR POLLUTION MONITORING

BEAM EMITTANCE
Beam trajectory jitter in the SLC linac, 20:21919 (R;US)
Characterization of beam position monitors for measurement of second moment, 20:21978 (R;US)
Collective behavior of an ensemble of forced duffing oscillators near the 1:1 resonance. Revision 1, 20:21932 (R;US)
Emittance growth due to noise and its suppression with the Feedback system in large hadron colliders, 20:21927 (R;US)
Emittance growth due to power ripple in a hadron collider, 20:21928 (R;US)
Growth rate in terms of $Z_{\perp}$, 20:21922 (R;US)
Is transverse feedback necessary for the SSC emittance preservation? (Vibration noise analysis and feedback parameters optimization), 20:21873 (R;US)
BEAM FOCUSING MAGNETS
Design, construction, and procurement methodology of magnets for the 7-GeV Advanced Photon Source, 20:21936 (R;US)
Half-year progress report FY92/93 NRL HIFAR research program, August 1, 1992–June 31, 1993, 20:21901 (R;US)
Performance of the 1994/95 SLC final focus system, 20:21994 (R;US)
Superconducting 8 CM Corrector magnets for the relativistic heavy ion collider (RHIC), 20:21958 (R;US)
The beam envelope equation-systematic solution for a periodic quadrupole lattice with space charge, 20:21911 (R;US)
BEAM INJECTION
Simulations of transition crossing in the main injector, 20:21905 (R;US)
The Fermilab Main Injector dipole and quadrupole cooling design and bus connections, 20:21969 (R;US)
BEAM MONITORS
A VXI-based, integrated system of beam position monitoring and rf measuremednt for the Advanced Photon Source (APS) linear accelerator, 20:21939 (R;US)
A bipolar integrator for secondary emission profile monitors at the SSCL, 20:22014 (R;US)
Characterization of beam position monitors for measurement of second moment, 20:21978 (R;US)
Ion-chamber-based loss monitor system for the Los Alamos Meson Physics Facility, 20:21980 (R;US)
SSCL RFQ-DTL Matching Section instrumentation, 20:22045 (R;US)
BEAM OPTICS
Compendation of SSC lattice optics in the presence of dipole field errors: Report of the Correction Element Working Group, 20:21933 (R;US)
Design, simulation and visualization of ultrafast electron optical devices, 20:21893 (RA;US)
Second order focusing property of 210deg cylindrical energy analyzer, 20:22858 (R;JP)
BEAM PERVEANCE
See BEAM EMITTANCE
BEAM PROFILES
A bipolar integrator for secondary emission profile monitors at the SSCL, 20:22014 (R;US)
A low diffraction beam technique for scanning in the shallow ocean, 20:22117 (R;US)
BEAM TRANSPORT
Beam trajectory jitter in the SLC linac, 20:21919 (R;US)
Calculation of the coupling impedances of holes and slots on the liner using MAFIA and scaling, 20:21924 (R;US)
TRANSFER. Beam Transfer Simulation Program, 20:22938 (CM;US)
BEAM WIDTHS
See BEAM PROFILES
BEAM-BEAM INTERACTIONS
A map for the thick beam-beam interaction, 20:21918 (R;US)
The clustered interaction region option for the SSC, 20:21935 (R;US)
BEAM-PLASMA SYSTEMS
Investigation of focusing of relativistic electron and positron bunches moving in cold plasma. Final report, 20:21910 (R;US)
BEAUTY MODEL

Potential study of an environment harmony type coal utilization system. Potential study of an environment harmony type coal utilization system in the industrial sector in China, 20:20568 (R;JP;In Japanese)
Air Pollution
Harmful emissions from the combustion of fuels, 20:20718 (RA;CZ;In Czech)
Appropriate Technology
Encouragement subsidies for the coal production/utilization. Next-generation coal utilization technology (first next-generation coal technology committee), 20:20567 (R;JP;In Japanese)
Potential study of an environment harmony type coal utilization system. Potential study of an environment harmony type coal utilization system in the industrial sector in China, 20:20568 (R;JP;In Japanese)
Biodegradation
Regulation of coal polymer degradation by fungi, Second quarterly report, [October–December 1994], 20:20563 (R;US)
Briquetting
Potential study of an environment harmony type coal utilization system. Potential study of an environment harmony type coal utilization system in the industrial sector in China, 20:20568 (R;JP;In Japanese)
Chemical Analysis
Investigation of mineral transformations and ash deposition during staged combustion. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:20594 (R;US)
Chemical Properties
Maintenance of the coal sample bank and database. Quarterly technical progress report, July 1, 1994–September 30, 1994, 20:20573 (R;US)
China
Potential study of an environment harmony type coal utilization system. Potential study of an environment harmony type coal utilization system in the industrial sector in China, 20:20568 (R;JP;In Japanese)
Circulating Systems
Potential study of an environment harmony type coal utilization system. Potential study of an environment harmony type coal utilization system in the industrial sector in China, 20:20568 (R;JP;In Japanese)
Cleaning
Electrostatic beneficiation of coal, 20:20525 (R;US)
Engineering design and analysis of advanced physical fine coal cleaning technologies. Final report, 20:20528 (R;US)
Engineering development of advanced froth flotation. Volume 2, Final report, 20:20526 (R;US)
Cocombustion
Enhancing the use of coals by Gas Reburning: Sorbent injection. [Quarterly report], July 28–October 1, 1993, 20:20587 (R;US)
Combustion
Coal combustion science quarterly progress report, January 1994–March 1994, 20:20596 (R;US)
Design manual for management of solid by-products from advanced coal technologies, 20:20575 (R;US)
Development and testing of a high efficiency advanced coal combustor: Phase 3 industrial boiler retrofit. Quarterly technical progress report No. 11, April 1, 1994–June 30, 1994, 20:20590 (R;US)
Engineering development of advanced coal-fired low-emission boiler systems. Technical progress report No. 9, September 1994–December 1994, 20:20591 (R;US)
Harmful emissions from the combustion of fuels, 20:20718 (RA;CZ;In Czech)
Issues in the assessment of congenital health risks from mercury in coal, 20:21168 (R;US)
NOx control subsystem test plan: LEBS Phase II, 20:20592 (R;US)
The development of coal-based technologies for Department of Defense facilities. Semiannual technical progress report, March 28, 1994–September 27, 1994, 20:20529 (R;US)
Combustion Kinetics
Char particle fragmentation and its effect on unburned carbon during pulverized coal combustion. Quarterly report, October 1–December 31, 1994, 20:20593 (R;US)
Commercialization
Potential survey of an environment harmony type coal utilization system. Potential survey of an environment harmony type coal utilization system in sectors except the coal industry in China, 20:20597 (R;JP;In Japanese)
Comminution
Engineering development of advanced coal-fired low-emission boiler systems. Technical progress report No. 9, September 1994–December 1994, 20:20591 (R;US)
Compiled Data
Quarterly coal report, October–December 1994, 20:20571 (R;US)
Coprocessing
Bench-scale co-processing economic assessment. Final report, 20:20538 (R;US)
Exploratory coprocessing research. Quarterly report Number 10, December 1, 1990–February 28, 1991, 20:20540 (R;US)
Exploratory coprocessing research. Quarterly report Number 9, September 1–November 30, 1990, 20:20539 (R;US)
Dissolution
Photochemical coal dissolution. Quarterly technical progress report, January 1–March 31, 1995, 20:20561 (R;US)
District Heating
Conversion of energy and power sources to gas fuel: effects on air quality, 20:20719 (RA;CZ;In Czech)
Energy Efficiency
Potential survey of an environment harmony type coal utilization system. Potential survey of an environment harmony type coal utilization system in sectors except the coal industry in China, 20:20597 (R;JP;In Japanese)
Environmental Impacts
Environmental Impact Report for thermoelectric from coal in Candiota region - Brazil, 20:20579 (I;BR;In Portuguese)
Environmental Quality
Potential survey of an environment harmony type coal utilization system. Potential survey of an environment harmony type

coal utilization system in sectors except the coal industry in China, 20:20597 (R;JP;In Japanese)

Feasibility Studies
Potential study of an environment harmony type coal utilization system. Potential study of an environment harmony type coal utilization system in the industrial sector in China, 20:20568 (R;JP;In Japanese)
Potential survey of an environment harmony type coal utilization system. Potential survey of an environment harmony type coal utilization system in sectors except the coal industry in China, 20:20597 (R;JP;In Japanese)

Financial Incentives
Encouragement subsidies for the coal production/utilization. Next-generation coal utilization technology (first next-generation coal technology committee), 20:20567 (R;JP;In Japanese)

Flotation
Engineering development of advanced froth flotation. Volume 2, Final report, 20:20526 (R;US)
POC-scale testing of an advanced equipment/technology. Quarterly technical progress report No. 1, October–December 1994, 20:20530 (R;US)

Fluidized Beds
Potential study of an environment harmony type coal utilization system. Potential study of an environment harmony type coal utilization system in the industrial sector in China, 20:20568 (R;JP;In Japanese)

Fluidized-Bed Combustion
Second Generation Pressurized Fluidized-Bed Combustion (PFBC). Phase 1, Task 4: Circulating PFB combustor, Test results, 20:21154 (R;US)

Forecasting
Short-term energy outlook: Quarterly projections. Second quarter 1995, 20:21414 (R;US)

Fossil-Fuel Power Plants
Environmental Impact Report for thermoelectric from coal in Candiota region - Brazil, 20:20579 (I;BR;In Portuguese)

Fuel Fabrication Plants
Potential study of an environment harmony type coal utilization system. Potential study of an environment harmony type coal utilization system in the industrial sector in China, 20:20568 (R;JP;In Japanese)

Inventories
Maintenance of the coal sample bank and database. Quarterly technical progress report, July 1, 1994–September 30, 1994, 20:20573 (R;US)

Mining Engineering
Encouragement subsidies for the coal production/utilization. Next-generation coal utilization technology (first next-generation coal technology committee), 20:20567 (R;JP;In Japanese)

Mixtures
Potential study of an environment harmony type coal utilization system. Potential study of an environment harmony type coal utilization system in the industrial sector in China, 20:20568 (R;JP;In Japanese)

Photolysis
Photochemical coal dissolution. Quarterly technical progress report, January 1–March 31, 1995, 20:20561 (R;US)

Prices
Short-term energy outlook: Quarterly projections. Second quarter 1995, 20:21414 (R;US)

Slurry Pipelines
Potential study of an environment harmony type coal utilization system. Potential study of an environment harmony type coal utilization system in the industrial sector in China, 20:20568 (R;JP;In Japanese)

Staged Combustion
Development and testing of a high efficiency advanced coal combustor: Industrial boiler retrofit, 20:20585 (R;US)
Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, October 1993–December 1993, 20:20589 (R;US)
Enhancing the use of coals by Gas Reburning: Sorbent injection. [Quarterly report], July 28–October 1, 1993, 20:20587 (R;US)
Enhancing the use of coals by gas reburning-sorbent injection. Volume 2, Gas reburning-sorbent injection at Hennepin Unit 1, Illinois Power Company, 20:20586 (R;US)
Investigation of mineral transformations and ash deposition during staged combustion. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:20594 (R;US)

Supply and Demand
Short-term energy outlook: Quarterly projections. Second quarter 1995, 20:21414 (R;US)

Swelling
Advanced liquefaction using coal swelling and catalyst dispersion techniques. Quarterly progress report, July–September 1993, 20:20557 (R;US)

Transport
Coal log pipeline research at the University of Missouri. 4th Quarterly report for 1994, October 1, 1994–December 31, 1994, 20:20582 (R;US)

Water
Potential study of an environment harmony type coal utilization system. Potential study of an environment harmony type coal utilization system in the industrial sector in China, 20:20568 (R;JP;In Japanese)

Water Removal
POC-scale testing of an advanced equipment/technology. Quarterly technical progress report No. 1, October–December 1994, 20:20530 (R;US)

Wear
Coal log pipeline research at the University of Missouri. 4th Quarterly report for 1994, October 1, 1994–December 31, 1994, 20:20582 (R;US)

COAL FINES
Engineering development of advanced physical fine coal cleaning technologies: Froth flotation. Quarterly technical progress report No. 25, October 1, 1994–December 31, 1994, 20:20527 (R;US)

COAL GAS
Fluidized-bed testing of Z-SORB III sorbent, 20:20533 (R;US)
High-temperature membranes for H_2S and SO_2 separations. Final report, 20:20555 (R;US)

COAL GASIFICATION
Utilization of lightweight materials made from coal gasification slags. Quarterly report, December 1994–February 1995, 20:20536 (R;US)

COAL GASIFICATION PLANTS
Conceptual design report – Gasification Product Improvement Facility (GPIF), 20:20535 (R;US)

COAL LIQUEFACTION
Advanced liquefaction using coal swelling and catalyst dispersion techniques. Quarterly progress report, July–September 1993, 20:20557 (R;US)
Advanced liquefaction using coal swelling and catalyst dispersion techniques. Volume 1, Final technical report, October 1, 1991–September 30, 1994, 20:20556 (R;US)
Configurational diffusion of asphaltenes in fresh and aged catalyst extrudates. Quarterly progress report, December 20, 1994–March 20, 1995, 20:20559 (R;US)
Evaluation of West Virginia University's iron catalyst impregnated on coal, 20:20569 (R;US)
Exploratory coprocessing research. Quarterly report Number 10, December 1, 1990–February 28, 1991, 20:20540 (R;US)
Exploratory coprocessing research. Quarterly report Number 9, September 1–November 30, 1990, 20:20539 (R;US)
Microbial recovery of metals from spent coal liquefaction catalysts. Final report, 20:20541 (R;US)
Novel nanodispersed coal liquefaction catalysts: Molecular design via microemulsion-based synthesis. Technical progress report, April 1992–June 1992, 20:20549 (R;US)
Novel nanodispersed coal liquefaction catalysts: Molecular design via microemulsion-based synthesis. Technical progress report, January 1992–March 1992, 20:20548 (R;US)
Novel nanodispersed coal liquefaction catalysts: Molecular design via microemulsion-based synthesis. Technical progress report, July 1992–September 1992, 20:20550 (R;US)

Novel nanodispersed coal liquefaction catalysts: Molecular design via microemulsion-based synthesis. Technical progress report, January 1993–March 1993, 20:20552 (R;US)
Novel nanodispersed coal liquefaction catalysts: Molecular design via microemulsion-based synthesis. Technical progress report, October 1992–December 1992, 20:20551 (R;US)
Novel nanodispersed coal liquefaction catalysts: Molecular design via microemulsion-based synthesis. Technical progress report, July–September 1993, 20:20554 (R;US)
Novel nanodispersed coal liquefaction catalysts: Molecular design via microemulsion-based synthesis. Technical progress report, April 1993–June 1993, 20:20553 (R;US)
Role of the resid solvent in catalytic coprocessing with finely divided catalysts. Quarterly report, January–March 1995, 20:20558 (R;US)

COAL LIQUIDS
Deashing of coal liquids with ceramic membrane microfiltration and diafiltration. Final quarterly technical progress report, October 1–December 31, 1994, 20:20560 (R;US)
Supercritical fluid reactions for coal processing. Quarterly progress report, January 1, 1995–March 31, 1995, 20:20562 (R;US)

COAL MINERS
Branch project mining industry: Development of a system for epidemiological analyses in the occupational medicine (SEPIA). Final report, 20:20599 (R;DE;In German)

COORDINATED RESEARCH PROGRAMS
Research and development related to oil and natural gas 1995 - 1999. Plan of management, 20:21420 (R;DK;In Danish)
Research and development related to oil and natural gas 1995 - 1999. Supplement to the plan of management, 20:21395 (R;DK;In Danish)
Suggestion for development programme for bioenergy, 20:21440 (R;DK;In Danish)

COPPER
A cross section measurement of charm hyperons Ξ_c^+ and Ξ_c^0 in 250 GeV p/K/π-nucleon interactions, 20:22698 (R;US)
Optical anisotropy of (110) surfaces of Ag and Cu, 20:21582 (R;US)
Relation between electrical resistivity and argon concentration of copper thin films prepared by ion-beam-assisted deposition, 20:21581 (IA;JP;In Japanese)
Strange particle measurements from the EOS TPC, 20:22765 (R;US)

COPPER OXIDES
Antiferromagnetism
What is the origin of ω/T scaling in the cuprate superconductors?, 20:22832 (RA;US)
Band Theory
A nearly antiferromagnetic Fermi liquid description of magnetic scaling and spin gap behavior in the cuprate superconductors, 20:22831 (RA;US)
Crystal Defects
Defect formation and carrier doping in epitaxial films of the "parent" compound $SrCuO_2$: Synthesis of two superconductors descendants, 20:21616 (R;US)
Crystal Lattices
Lattice and multi-band electronic effects in high-temperature superconductors, 20:22827 (RA;US)
Crystal Structure
Evidence for symmetry breaking local distortions in $Tl_2Ba_2NuO_6$, 20:22825 (RA;US)
Electric Conductivity
Impurities and conductivity in a D-wave superconductor, 20:22836 (RA;US)
Theoretical framework for the normal state of copper oxide metals, 20:22839 (RA;US)
Fermi Level
Lattice and multi-band electronic effects in high-temperature superconductors, 20:22827 (RA;US)
Hubbard Model
About superconductivity in electronic models for the high-T_c cuprates, 20:22834 (RA;US)
Isotopic Exchange
Site-selective oxygen isotope shift in $YBa_2Cu_3O_7$, 20:22826 (RA;US)
Magnetic Flux
Origin of 1/f noise peaks of $YBa_2Cu_3O_x$ films in a magnetic field, 20:21611 (R;US)
Magnetic Properties
A nearly antiferromagnetic Fermi liquid description of magnetic scaling and spin gap behavior in the cuprate superconductors, 20:22831 (RA;US)
Impurities: A smoking gun for the physical origin of high temperature superconductivity, 20:21623 (RA;US)
Magnetic Susceptibility
What is the origin of ω/T scaling in the cuprate superconductors?, 20:22832 (RA;US)
Mathematical Models
Strongly anisotropic s-wave vs. d-wave gap in cuprate superconductors: Evidence and theory, 20:21624 (RA;US)
Molecular Beam Epitaxy
Molecular beam epitaxy of high-Tc superconductors. Final report, 20:21621 (R;DE;In German)
Numerical Solution
About superconductivity in electronic models for the high-T_c cuprates, 20:22834 (RA;US)
Order Parameters
The phase diagram and the spin gap state in cuprates: Gauge theory, 20:22837 (RA;US)
Phase Diagrams
On the phase diagram of $La_{2-x}Sr_xCuO_4$, 20:22840 (RA;US)
The phase diagram and the spin gap state in cuprates: Gauge theory, 20:22837 (RA;US)
Phase Studies
Electronic phase separation and high temperature superconductors, 20:22841 (RA;US)
Phonons
Effect of finite quasiparticle lifetime on the frequency dependence of phonon lifetimes in $d_{x^2-y^2}$ superconductors, 20:22828 (RA;US)
Superconductivity
Defect formation and carrier doping in epitaxial films of the "parent" compound $SrCuO_2$: Synthesis of two superconductors descendants, 20:21616 (R;US)
Effect of lead content on Bi-2223 Formation by a two-powder process, 20:21606 (R;US)
Synthesis
Defect formation and carrier doping in epitaxial films of the "parent" compound $SrCuO_2$: Synthesis of two superconductors descendants, 20:21616 (R;US)
Transition Temperature
Impurities: A smoking gun for the physical origin of high temperature superconductivity, 20:21623 (RA;US)
Site-selective oxygen isotope shift in $YBa_2Cu_3O_7$, 20:22826 (RA;US)
Zero Sound
Mott-induced structural transition in 2D metals electrons in the overdoped limit, 20:22829 (RA;US)

COPPER SELENIDE SOLAR CELLS
Processing and modeling issues for thin-film solar cell devices. Annual subcontract report, January 16, 1994–January 15, 1995, 20:21116 (R;US)

COPPER SELENIDES
Processing and modeling issues for thin-film solar cell devices. Annual subcontract report, January 16, 1994–January 15, 1995, 20:21116 (R;US)

COPROCESSING
Bench-scale co-processing economic assessment. Final report, 20:20538 (R;US)

CORE FLOODING SYSTEMS
Reflood modeling under oscillatory flow conditions with Cathare, 20:21294 (R;FR)

CORES (DRILL)

Status of special reactor process tube loadings, February 1, 1969, 20:21275 (R;US)
Status of special reactor process tube loadings, September 1, 1968, 20:21272 (R;US)

HANFORD RESERVATION
GXQ program user's guide. Revision 1, 20:22253 (R;US)

Alarm Systems
GENRTC Project No. 2F3E0A, OCB A-382, acceptance test procedure, 20:21853 (R;US)

Buildings
Preliminary project proposal for process area ventilation modifications 231-Z Building. Revision 1, 20:20735 (R;US)

Contamination
ABCASH plotting program users guide, 20:20986 (R;US)

Data Base Management
Tank waste source term inventory validation. Volume 1. Letter report, 20:20897 (R;US)
Tank waste source term inventory validation. Volume II. Letter report, 20:20898 (R;US)

Ecosystems
Wildlife studies on the Hanford site: 1994 Highlights report, 20:22326 (R;US)

Electrical Equipment
GENRTC Project No. 2F3E0A, OCB A-382, acceptance test procedure, 20:21853 (R;US)

Engineering
Long-term decontamination engineering study: Appendix A, Appendix B, Appendix C, Appendix D. Volume 2, 20:20933 (R;US)

Fuel Reprocessing Plants
Radioactive air emissions program notice of construction for the decommissioning of the 233-S Plutonium Concentration Facility Complex. Revision 1, 20:21014 (R;US)

Historical Aspects
Status of special reactor process tube loadings, April 1, 1967, 20:21268 (R;US)

Laboratories
Fire alarm system acceptance test procedure for Project W-164, Sample Equipment Cleaning Facility, 20:21038 (R;US)

Nuclear Materials Management
Basis document for sludge stabilization. Revision 1, 20:20858 (R;US)
Maintenance implementation plan for T Plant. Revision 2, 20:21788 (R;US)

Occupational Safety
Westinghouse Hanford Company health and safety performance report. Fourth quarter calendar year 1994, 20:21043 (R;US)

Program Management
300 Area fuel supply facilities deactivation mission analysis report, 20:20861 (R;US)

Radiation Hazards
Dose assessment from potential radionuclide emissions from stacks on the Hanford Site, 20:21034 (R;US)

Radiation Monitoring
Quality assurance program plan for radionuclide airborne emissions monitoring, 20:20985 (R;US)

Radiation Protection
Westinghouse Hanford Company ALARA year-end report, Calendar Year 1994: Revision 3, Radiological engineering and ALARA, 20:21044 (R;US)

Radioactive Effluents
Waste management plans, 20:20787 (R;US)

Radioactive Waste Disposal
Grout for closure of the demonstration vault at the US DOE Hanford Facility. Final report, 20:20781 (R;US)
Historical model evaluation data requirements, 20:20896 (R;US)
Operator coil monitoring Acceptance Test Procedure, 20:20882 (R;US)
Overview of the performance objectives and scenarios of TWRS Low-Level Waste Disposal Program. Revision 1, 20:20846 (R;US)
Preliminary design requirements document for Project W-378, low-level waste vitrification plant, 20:20879 (R;US)
Safety equipment list, 20:20870 (R;US)
Statements of work for FY 1995 to 2000, 20:20941 (R;US)

Radioactive Waste Facilities
Acceptance Test Procedure for Cathodic Protection, Rectifier 11, 20:20868 (R;US)
Central waste complex interim safety basis, 20:20937 (R;US)

Compliance matrix for the mixed waste disposal facilities, trenches 31 and 34, burial ground 218-W-5. Revision 2, 20:20942 (R;US)
Data quality objective to support resolution of the organic fuel rich tank safety issue, 20:20894 (R;US)
Data quality objectives for generic in-tank health and safety vapor issue resolution. Revision 1, 20:20893 (R;US)
Data requirements for the Ferrocyanide Safety Issue developed through the data quality objectives process. Revision 1, 20:20895 (R;US)
Equipment sizing calculations for the Extensive Separations Alternative engineering data package, 20:20892 (R;US)
Evaluation of HWVP feed preparation chemistry for an NCAW simulant – Fiscal year 1993: Effect of noble metals concentration on offgas generation and ammonia formation, 20:20814 (R;US)
Fire hazard analysis of the radioactive mixed waste trenchs, 20:21042 (R;US)
Grout for closure of the demonstration vault at the US DOE Hanford Facility. Final report, 20:20781 (R;US)
Project W-320 ALARA Plan, 20:21039 (R;US)
Radiation screening of excavated waste at Hanford's 118-B-1 burial site, 20:21023 (R;US)
T Plant canyon deck-level allowable floor-load study, 20:21041 (R;US)
Tank 241-BY-108 vapor sampling and analysis tank characterization report. Revision 1, 20:20904 (R;US)
Waste volume reduction factors for potential 242-A evaporator feed, 20:20945 (R;US)

Radioactive Waste Management

300 Area fuel supply facilities deactivation mission analysis report, 20:20861 (R;US)
308 Building deactivation mission analysis report, 20:20860 (R;US)
309 Building deactivation mission analysis report, 20:20865 (R;US)
45-Day safety screen results for tank 241-C-105, push mode, cores 72 and 76, 20:20887 (R;US)
45-Day safety screen results for tank 241-U-202, push mode, cores 75 and 78, 20:20889 (R;US)
A parametric study of double-shell tank response to internal high-frequency pressure loading, 20:20851 (R;US)
Acceptance test procedure for the 105-KW isolation barrier leak rate, 20:20863 (R;US)
B plant mission analysis report, 20:20938 (R;US)
Compliance matrix for the mixed waste disposal facilities, trenches 31 and 34, burial ground 218-W-5. Revision 2, 20:20942 (R;US)
Educational understanding of pollution prevention in decontamination and decommissioning/environmental restoration activities, 20:20853 (R;US)
Interim safety basis for fuel supply shutdown facility, 20:20862 (R;US)
Laboratory waste minimization during the operation startup phase, 20:20854 (R;US)
Long-term decontamination engineering study: Appendix A, Appendix B, Appendix C, Appendix D. Volume 2, 20:20933 (R;US)
Multi-Function Waste Tank Facility phase out basis. Revision 1, 20:20873 (R;US)
Neural network based analysis for chemical sensor arrays, 20:20818 (R;US)
Operability test report for the TK-900 effluent monitoring station, 20:20940 (R;US)
Performance benefits of telerobotics and teleoperation - enhancements for an arm-based tank waste retrieval system, 20:20824 (R;US)
Project W-236A multi-function waste tank facility waste feed projections, 20:20877 (R;US)
Quality Assurance Program Plan for the Waste Sampling and Characterization Facility, 20:20859 (R;US)
Replacement of the cross-site transfer system liquid waste transport alternatives evaluation, Project W-058, 20:20742 (R;US)
Site management system executive summary report – March 1995, 20:20955 (R;US)
Tank 241-BY-104 vapor sampling and analysis tank characterization report. Revision 1, 20:20899 (R;US)
Tank 241-BY-105 vapor sampling and analysis tank characterization report. Revision 1, 20:20900 (R;US)
Tank 241-BY-106 vapor sampling and analysis tank characterization report. Revision 1, 20:20901 (R;US)
Tank 241-BY-107 vapor sampling and analysis tank characterization report, 20:20902 (R;US)
Tank 241-BY-107 vapor sampling and analysis tank characterization report. Revision 1, 20:20903 (R;US)
Tank 241-BY-111 vapor sampling and analysis tank characterization report, 20:20915 (R;US)
Tank 241-BY-112 vapor sampling and analysis tank characterization report, 20:20916 (R;US)
Tank 241-C-104 vapor sampling and analysis tank characterization report, 20:20917 (R;US)
Tank 241-C-108 vapor sampling and analysis tank characterization report. Revision 1, 20:20906 (R;US)
Tank 241-C-112 vapor sampling and analysis tank characterization report. Revision 1, 20:20910 (R;US)
Tank 241-S-102 vapor sampling and analysis tank characterization report, 20:20921 (R;US)
Tank 241-SX-115 tank characterization plan, 20:20946 (R;US)
Tank 241-TX-105 vapor sampling and analysis tank characterization report, 20:20923 (R;US)
Tank 241-TX-118 vapor sampling and analysis tank characterization report, 20:20924 (R;US)
Tank 241-U-107 vapor sampling and analysis tank characterization report, 20:20925 (R;US)
Tank 241-U-111 vapor sampling and analysis tank characterization report, 20:20926 (R;US)
Tank SY-102 remediation project summary report: ASPEN modeling, 20:20793 (R;US)
Tank waste source term inventory validation. Volume 1. Letter report, 20:20897 (R;US)
Tank waste source term inventory validation. Volume II. Letter report, 20:20898 (R;US)
Using tank 107-AN caustic addition for confirmation of mixing scale relationship, 20:20874 (R;US)
Vapor space characterization of waste tank 241-BY-105 (in situ): Results from samples collected on May 9, 1994, 20:20816 (R;US)
Vapor space characterization of waste tank 241-BY-105: Results from samples collected on 7/7/94, 20:20815 (R;US)
Waste management plans, 20:20787 (R;US)
Waste shipment engineering data management plan, 20:20743 (R;US)
Work plan for the identification of techniques for in-situ sensing of layering/interfaces of Hanford high level waste tanks, 20:20954 (R;US)

Radioactive Waste Processing

Preliminary design requirements document for Project W-378, low-level waste vitrification plant, 20:20879 (R;US)
Testing and development strategy for the tank waste remediation system, 20:20944 (R;US)

Radioactive Waste Storage

242-A/LERF programmable Logic Controller Ladder. Revision 1, 20:20869 (R;US)
45-Day safety screen results for Tank 241-BY-103, auger samples 95-AUG-012 and 95-AUG-013, 20:20886 (R;US)
45-day safety screen results and final report for Tank 241-C-203, Auger samples 95 AUG-020 and 95-AUG-021, 20:20890 (R;US)
Engineering Task Plan for Tank 241-C-106 contingency chiller definitive design, 20:20935 (R;US)
Functional design criteria SY tank farm cathodic protection, 95G-EWW-430, 20:20880 (R;US)
Functional design criteria for the retained gas sampler system, 20:20936 (R;US)
Safety evaluation of the ITP filter/stripper test runs and quiet time runs using simulant solution. Revision 3, 20:20960 (R;US)
Standard-B auto grab sampler hydrogen monitoring system, Acceptance Test Report, 20:20883 (R;US)

Tank 241-B-203 Push Mode Core Sampling and Analysis Plan, 20:20951 (R;US)
Test plan for auger sampler improvements, 20:20949 (R;US)
Waste segregation analysis for salt well pumping in the 200 W Area – Task 3.4, 20:20875 (R;US)

Radiometric Surveys
Quarterly environmental radiological survey summary: First quarter 1995 100, 200, 300, and 600 Areas, 20:20988 (R;US)

Reactor Fueling
Status of special reactor process tube loadings, April 1, 1967, 20:21268 (R;US)

Safety
Draft of Mission No. 8 Nuclear Safety Program, 20:21015 (R;US)

Security
Operations Security Assessment of the Department of Energy's Richland Operation Office, Final Report (SAS-4394-HQ), 20:21290 (R;US)

Sewage
300 Area process sewer piping upgrade and 300 Area treated effluent disposal facility discharge to the City of Richland Sewage System, Hanford Site, Richland, Washington, 20:21511 (R;US)

Solid Wastes
Solid Waste Operations Complex W-113: Project cost estimate. Preliminary design report. Volume IV, 20:20784 (R;US)

Storage Facilities
Concrete material characterization reinforced concrete tank structure Multi-Function Waste Tank Facility, 20:20871 (R;US)

Tanks
45-Day safety screen results for tank 241-U-203, push mode, cores 79 and 80, 20:20888 (R;US)
Functional design criteria SY tank farm cathodic protection, 95G-EWW-430, 20:20880 (R;US)
Tank 241-C-108 vapor sampling and analysis tank characterization report, 20:20905 (R;US)

Terrestrial Ecosystems
Concentrations of radionuclides in terrestrial vegetation on the Hanford site of potential interest to Native Americans, 20:21021 (R;US)

Waste Management
Centralized consolidation/recycling center, 20:20850 (R;US)
Solid Waste Operations Complex W-113: Project cost estimate. Preliminary design report. Volume IV, 20:20784 (R;US)

Waste Transportation
Replacement of the cross-site transfer system liquid waste transport alternatives evaluation, Project W-058, 20:20742 (R;US)
Waste shipment engineering data management plan, 20:20743 (R;US)

Water Treatment
Hanford facilities tracer study report (315 Water Treatment Facility) Revision 1, 20:22355 (R;US)

Water Treatment Plants
Hanford facilities tracer study report (315 Water Treatment Facility), 20:21036 (R;US)

HARBORS

Kinetic measurements on the silicates of the Yucca Mountain potential repository. [Final report], January–September 1994, 20:20797 (R;US)
Meteorological, stream-discharge, and water-quality data for water year 1992 from two basins in Central Nevada (Yucca Mountain Project), 20:20844 (R;US)
Plutonium carbonate speciation changes as measured in dilute solutions with photoacoustic spectroscopy: Yucca Mountain Site Characterization Program Milestone report 3350 (Yucca mountain project), 20:20790 (R;US)
Progress report on pre-test calculations for the large block test, 20:20831 (R;US)
Release of radon contaminants from Yucca Mountain: The role of buoyancy driven flow, 20:20764 (R;US)
Studies of thermohydrologic flow processes using TOUGH2. Yucca Mountain Site Characterization Project, 20:20821 (R;US)
Summary of lithologic logging of new and existing boreholes at Yucca Mountain, Nevada, August 1993 to February 1994, 20:20843 (R;US)
The large block test, a progress report, 20:20838 (R;US)
Yucca Mountain Project - Argonne National Laboratory annual progress report, FY 1994, 20:20747 (R;US)
Yucca Mountain Site Characterization Project Bibliography, July, December 194: An update, 20:20782 (R;US)
Underground Storage
A parametric study of double-shell tank response to internal high-frequency pressure loading, 20:20851 (R;US)
A progress report for the large block test of the coupled thermal-mechanical-hydrological-chemical processes, 20:20982 (R;US)
Aging mechanisms for concrete components of High-Level Waste storage tanks, 20:20767 (R;US)
Laboratory studies of gas generation and potential for tank wall corrosion during blending of high-level wastes at the West Valley Demonstration Project, 20:20817 (R;US)
Tank SY-102 remediation project summary report: ASPEN modeling, 20:20793 (R;US)
Work plan for the identification of techniques for in-situ sensing of layering/interfaces of Hanford high level waste tanks, 20:20954 (R;US)
Vitrification
Evaluation of HWVP feed preparation chemistry for an NCAW simulant – Fiscal year 1993: Effect of noble metals concentration on offgas generation and ammonia formation, 20:20814 (R;US)
The effect of chemical composition on the PCT durability of mixed waste glasses from wastewater treatment sludges, 20:20956 (R;US)
HIGH-PURITY GE DETECTORS
Sensitivity of LDEF foil analyses using ultra-low background germanium vs. large NaI(Tl) multidimensional spectrometers, 20:22102 (R;US)
HIGH-TC SUPERCONDUCTORS
The heavy electron state. Final report, February 1, 1991–August 31, 1994, 20:21649 (R;US)
Antiferromagnetism
What is the origin of ω/T scaling in the cuprate superconductors?, 20:22832 (RA;US)
Band Theory
A nearly antiferromagnetic Fermi liquid description of magnetic scaling and spin gap behavior in the cuprate superconductors, 20:22831 (RA;US)
Coherence Length
Short coherence length superconductors: Intermediate regime between BCS and bosons, 20:22842 (RA;US)
Critical Current
Effect of the colony microstructure on transport critical current of high-J_c Tl-1223 thick films, 20:21617 (R;US)
Crystal Lattices
Lattice and multi-band electronic effects in high-temperature superconductors, 20:22827 (RA;US)
Electric Conductivity
Impurities and conductivity in a D-wave superconductor, 20:22836 (RA;US)
Theoretical framework for the normal state of copper oxide metals, 20:22839 (RA;US)

Electron-Phonon Coupling
High Tc superconductivity with polarons and bipolarons an approach from the insulating states, 20:22821 (R;FR)
Energy Beam Deposition
Formation of artificially-layered high-temperature superconductors using pulsed-laser deposition, 20:21645 (R;US)
Energy Gap
Spin fluctuations and high temperature superconductors, 20:22833 (RA;US)
Fermi Level
Lattice and multi-band electronic effects in high-temperature superconductors, 20:22827 (RA;US)
Hubbard Model
About superconductivity in electronic models for the high-T_c cuprates, 20:22834 (RA;US)
Magnetic Flux
The interaction of vortices with twin boundaries, 20:22820 (R;US)
Magnetic Properties
A nearly antiferromagnetic Fermi liquid description of magnetic scaling and spin gap behavior in the cuprate superconductors, 20:22831 (RA;US)
Impurities: A smoking gun for the physical origin of high temperature superconductivity, 20:21623 (RA;US)
Spin fluctuations and high temperature superconductors, 20:22833 (RA;US)
Magnetic Susceptibility
What is the origin of ω/T scaling in the cuprate superconductors?, 20:22832 (RA;US)
Mathematical Models
Strongly anisotropic s-wave vs. d-wave gap in cuprate superconductors: Evidence and theory, 20:21624 (RA;US)
Meetings
High Tc superconductivity with polarons and bipolarons an approach from the insulating states, 20:22821 (R;FR)
Nmr Imaging
Experimental evidence for spin fluctuations in high temperature superconductors, 20:22830 (RA;US)
Numerical Solution
About superconductivity in electronic models for the high-T_c cuprates, 20:22834 (RA;US)
Order Parameters
The phase diagram and the spin gap state in cuprates: Gauge theory, 20:22837 (RA;US)
Phase Diagrams
The phase diagram and the spin gap state in cuprates: Gauge theory, 20:22837 (RA;US)
Phase Studies
Electronic phase separation and high temperature superconductors, 20:22841 (RA;US)
Phonons
Effect of finite quasiparticle lifetime on the frequency dependence of phonon lifetimes in $d_{x^2-y^2}$ superconductors, 20:22828 (RA;US)
Polarons
High Tc superconductivity with polarons and bipolarons an approach from the insulating states, 20:22821 (R;FR)
Structural Chemical Analysis
Experimental evidence for spin fluctuations in high temperature superconductors, 20:22830 (RA;US)
T Invariance
D-wave superconductivity with a gap, 20:22838 (RA;US)
Transition Temperature
Impurities: A smoking gun for the physical origin of high temperature superconductivity, 20:21623 (RA;US)
Uses
Applications of bulk high-temperature superconductors, 20:22819 (R;US)
Zero Sound
Mott-induced structural transition in 2D metals electrons in the overdoped limit, 20:22829 (RA;US)
HIGHLY ENRICHED URANIUM
Advanced Neutron Source enrichment study. Volume 2: Appendices -- Final report, Revision 12/94, 20:21260 (R;US)
Disposition of highly enriched uranium obtained from the Republic of Kazakhstan. Environmental assessment, 20:20977 (R;US)
HIPURE PROCESS

HOLLY EVENT
See NUCLEAR EXPLOSIONS
HOLMIUM
Theory of magneto-optics and circular magnetic x-ray dichroism, 20:22785 (R;US)
HOLMIUM 156
Effect of nuclear deformation on probabilities of α-, β- and the transitional region $N \simeq 88$. Structure of nuclei in γ-transitions in nuclei with ($N \simeq 88$), 20:22683 (RA;RU)
HONG KONG
Analysis of industrial pollution prevention programs in selected Asian countries, 20:21347 (R;US)
HORIZONTAL AXIS TURBINES
A design study of a 1 MW stall regulated rotor, 20:21149 (R;DK)
HORMONES
Hormonal indices in cows with radionuclide injuries of the thyroid, 20:22447 (IA;RU;In Russian)
HOT CELLS
Shielded Cells D&D and Dismantlement System Requirements, 20:21793 (R;US)
Use of the Los Alamos Hot-Cell Facility for target fabrication and separation of molybdenum-99, 20:21063 (R;US)
HOT GAS CLEANUP
PFBC HGCU Test facility. Technical progress report, Fourth quarter, CY 1994, 20:20534 (R;US)
HOT SPRINGS
Geothermal development promotion survey in fiscal 1993 (Yamaaoizawa area No.C-2). Fiscal annual influence survey report on the environment, 20:21137 (R;JP;In Japanese)
Survey of fiscal 1993 geothermal development promotion. 38. Western area of Mt. Aso (Report on the third year environmental effect survey), 20:21141 (R;JP;In Japanese)
HOT-DRY-ROCK SYSTEMS
Fundamental investigation for widening utilization of hot dry rock resource, 20:21134 (R;JP;In Japanese)
HUBBARD MODEL
Metal insulator transition in strongly correlated electron systems, 20:22812 (RA;US)
Quantum critical phenomena and conformal invariance, 20:22802 (R;XA)
Spin and pairing correlations in a two-chain Hubbard model, 20:22835 (RA;US)
The mean field theory of the Mott Hubbard transition, 20:22810 (RA;US)
HUGENHOLTZ-PINES THEORY

SODIUM 32
SULFUR 30
TRITIUM
Excitation of few-nucleon systems accompanied by the meson cooling, 20:22673 (IA;RU)
Inclusive pion double charge exchange on light nuclei at intermediate energies, 20:22738 (IA;RU)

LIGHT SOURCES
High-field strong-focusing undulator designs for X-ray Linac Coherent Light Source (LCLS) applications, 20:21844 (R;US)

LIGHT WATER COOLED REACTORS
See WATER COOLED REACTORS

LIGHTING SYSTEMS
Fiber-optic, anti-cycling, high pressure sodium street light control. Final technical progress report, 20:21455 (R;US)
From the lab to the marketplace: Making America's buildings more energy efficient, 20:21470 (R;US)

LIGHTWOOD
See WOOD

LIGNIN
Development of a prototype lignin concentration sensor. Final report, 20:21074 (R;US)

LIGNITE
Exploratory coprocessing research. Quarterly report Number 10, December 1, 1990–February 28, 1991, 20:20540 (R;US)
Natural gas: evaluation, control, and improvement of its environmental impacts, 20:20721 (RA;CZ;In Czech)
The use of NMR techniques for the analysis of water in coal and the effect of different coal drying techniques on the structure and reactivity of coal. Final report, 20:20531 (R;US)

LIMING
Comparative protein microanalysis in the partners of a mycorrhizal symbiosis after acid sprinkle irrigation and liming at a spruce stand in 'Hoeglwald'. Final report, 20:22476 (R;DE;In German)

LINACS
See LINEAR ACCELERATORS

LINEAMENTS
Naturally fractured tight gas reservoir detection optimization, 20:20696 (R;US)

LINEAR ACCELERATORS

WASTE WATER
Environmental assessment operation of the HB-Line facility and frame waste recovery process for production of Pu-238 oxide at the Savannah River Site, 20:21003 (R;US)
Facility effluent monitoring plan for 242-A evaporator facility, 20:20984 (R;US)
Investigation-Derived Waste Management Plan. Revision 2, 20:20959 (R;US)

LIQUIDS
See also COAL LIQUIDS
LIQUID METALS
Sensing liquid properties with shear-mode resonator sensors, 20:22121 (R;US)

LITHIUM
Nonlocal stabilized jellium clusters, 20:22777 (R;XA)
Polymeric electrolytes for ambient temperature lithium batteries. Final report, 20:21332 (R;US)

LITHIUM 6
Electron paramagnetic resonance spectra of lithium-6 deuteride exposed to ultraviolet radiation and gas discharge plasma, 20:22789 (IA;RU)

LITHIUM 6 TARGET
Calculation of the pion photoproduction of ^{6} Li in the framework of a α-2 N model, 20:22748 (IA;RU)
Low energy proton capture in light nuclei. Progress report, September 1, 1993–June 8, 1994, 20:22699 (R;US)
Signature of MEC in the process ^{6} Li(γ, n p)α, 20:22744 (IA;RU)
The measurement of nuclear medium effects with K^{+}, 20:22695 (R;US)

LITHIUM 7 TARGET
Low energy proton capture in light nuclei. Progress report, September 1, 1993–June 8, 1994, 20:22699 (R;US)

LITHIUM ARSENIDES
Polymeric electrolytes for ambient temperature lithium batteries. Final report, 20:21332 (R;US)

LITHIUM DEUTERIDES
Electron paramagnetic resonance spectra of lithium-6 deuteride exposed to ultraviolet radiation and gas discharge plasma, 20:22789 (IA;RU)

LITHIUM FLUORIDES
Materials considerations for molten salt accelerator-based plutonium conversion systems, 20:21216 (R;US)
Polymeric electrolytes for ambient temperature lithium batteries. Final report, 20:21332 (R;US)

LITHIUM-SULFUR BATTERIES
Sulfide ceramics in molten-salt electrolyte batteries, 20:21328 (R;US)

LIVER
Effect of detoxication on the state of liver of irradiated animals, 20:22427 (IA;RU;In Russian)

LIZARDS
1994 Baseline biological studies for the Device Assembly Facility at the Nevada Test Site, 20:22471 (R;US)

LLNL ADVANCED TEST ACCELERATOR
Various ATA notes: 60, 79, 116, and 136, 20:22148 (R;US)

LMFBR TYPE REACTORS
See also EBR-2 REACTOR
Analysis of seismic/random tests on fuel and reflector mock-ups (Italian data) by core-seis, 20:21203 (RA;XA)
Assessment of the SE2-ANL code using EBR-II temperature measurements, 20:21194 (R;US)
Fluid-structure interaction experiments of PEC core mock-ups and numerical analysis performed by ENEA, 20:21197 (RA;XA)

Intercomparison of liquid metal fast reactor seismic analysis codes. V.1: Validation of seismic analysis codes using reactor core experiments. Proceedings of a research co-ordination meeting held in Vienna, 16-17 November 1993, 20:21196 (R;XA)
PEC core mock-up seismic analyses by the finds code, 20:21199 (RA;XA)
Seismic response analysis of the PEC reactor core mock-up, 20:21198 (RA;XA)

LNG

LOSS OF COOLANT
Analysis of an AP600 intermediate-size loss-of-coolant accident, 20:21255 (R;US)
Evaluation of single failure effects during loss of coolant accidents for a VVER-440 reactor, 20:21292 (R;US)

LOSSES (PARTICLES)
See PARTICLE LOSSES

LOUISIANA
The use of air injection to improve the double displacement processes, 20:20639 (RA;US)

LOW ALLOY STEELS
Towards predicting weld metal microstructure from fundamentals of transport phenomena, 20:21573 (R;US)

LOW CARBON-HIGH ALLOY STEELS
Fracture behavior of bainitic chromium-tungsten and chromium-molybdenum steels, 20:21566 (R;US)

LOW DOSE IRRADIATION
Methods of radiation biotechnology in turkey breeding, 20:22443 (IA;RU;In Russian)
Physico-technological qualities of sheep skin following external gamma low dose irradiation of lambs, 20:22451 (IA;RU;In Russian)

LOW INCOME GROUPS
Utility investments in low-income energy-efficiency programs, 20:21412 (R;US)

LOW-LEVEL RADIOACTIVE WASTES

Chemical Reactions
Introduction to Radcalc: A computer program to calculate the radiolytic production of hydrogen gas from radioactive wastes in packages, 20:20855 (R;US)

Containment
Early containment of high-alkaline solution simulating low-level radioactive waste stream in clay-bearing blended cement, 20:20856 (R;US)

Environmental Impacts
Remedial investigation report on Waste Area Group 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 1: Technical summary, 20:21009 (R;US)
Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 2, Appendix A: Characterization methods and data summary, 20:21010 (R;US)

Hydrogen Production
Introduction to Radcalc: A computer program to calculate the radiolytic production of hydrogen gas from radioactive wastes in packages, 20:20855 (R;US)

Land Transport
Environmental assessment for DOE permission for off-loading activities to support the movement of commercial low level nuclear waste across the Savannah River Site, 20:20739 (R;US)

Materials Handling
Proposed low-level radioactive waste handling building at Fermi National Accelerator Laboratory, Batavia, Illinois, 20:20974 (R;US)

Public Opinion
The Mixed Waste Management Facility: Technology selection and implementation plan, Part 2, Support processes, 20:20829 (R;US)

Radiation Monitoring
Lightguide-coupled sensor for in-situ radiation monitoring, 20:22271 (R;US)

Radioactive Waste Disposal
Reclamation of greater than Class C sealed sources at the Los Alamos National Laboratory, 20:20802 (R;US)
The Mixed Waste Management Facility: Technology selection and implementation plan, Part 2, Support processes, 20:20829 (R;US)

Radioactive Waste Management
Computer-aided waste management strategic planning and analysis, 20:20754 (R;US)
Facility accident analysis for low-level waste management alternatives in the US Department of Energy Waste Management Program, 20:20755 (R;US)
Field lysimeter investigations - test results. Low-level waste data base development program: Test results for fiscal years 1986, 1987, 1988, and 1989, 20:20808 (R;US)
Issues in performance assessments for disposal of US Department of Energy low-level waste, 20:20852 (R;US)
Update of the management strategy for Oak Ridge National Laboratory Liquid Low-Level Waste, 20:20810 (R;US)
Vitrification treatability studies of actual waste water treatment sludges, 20:20957 (R;US)

Radioactive Waste Processing
A process for treating radioactive water-reactive wastes, 20:20799 (R;US)
A process for treatment of mixed waste containing chemical plating wastes, 20:20800 (R;US)
Electrochemical treatment of mixed (hazardous and radioactive) wastes, 20:20801 (R;US)
Engineering report of plasma vitrification of Hanford tank wastes, 20:20912 (R;US)
Equipment sizing calculations for the Extensive Separations Alternative engineering data package, 20:20892 (R;US)
Evaluation of improved techniques for the removal of ^{90}Sr and ^{137}Cs from process wastewater and groundwater: Chabazite zeolite baseline study, 20:20811 (R;US)
Remotely controlled reagent feed system for mixed waste treatment Tank Farm, 20:20836 (R;US)
Thermal oxidation vitrification flue gas elimination system, 20:20752 (R;US)
WRAP module 1 treatment plan, 20:20867 (R;US)

Radiolysis
Introduction to Radcalc: A computer program to calculate the radiolytic production of hydrogen gas from radioactive wastes in packages, 20:20855 (R;US)

Remedial Action
The Formerly Utilized Sites Remedial Action Program (FUSRAP): Building stakeholder partnerships to achieve effective cleanup, 20:22270 (R;US)
Vitrification of low-level radioactive mixed waste at Argonne National Laboratory, 20:20753 (R;US)

Remote Handling
Robotic control architecture development for automated nuclear material handling systems, 20:21776 (R;US)

Underground Disposal
Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 4: Appendix C, Risk assessment, 20:21012 (R;US)
Underground Storage

The impact of technology on gas reserves, worldwide and in the Middle East, 20:20709 (IA;QA)

NATURAL GAS FUEL CELLS
Molten carbonate fuel cell (MCFC) product development test. Annual report, September 1993–September 1994, 20:21156 (R;US)

NATURAL GAS INDUSTRY
Natural gas monthly, May 1995, 20:20706 (R;US)
The feasibility assessment of a U.S. natural gas production reporting system uniform production reporting model. Final report, July 1993–June 1994, 20:21418 (R;US)
The future of gas: a global challenge. Conference book, 20:20708 (I;QA)

NATURAL GAS WELLS
A novel geotechnical/geostatistical approach for exploration and production of natural gas from multiple geologic strata. [Quarterly] technical progress report, January–March 1995, 20:20700 (R;US)
Development of a Near-Bit MWD system, 20:20702 (R;US)
USDOE study: Human health and ecological risk assessment for produced water discharges, 20:20648 (R;US)

NATURAL RADIOACTIVITY
Analysis of atmospheric concentrations of radon and thoron using beta counting technique, 20:22195 (R;XA)

NATURE RESERVES
Natural resources management activities and biodiversity maintenance. Progress report, July 1, 1994–June 30, 1995, 20:22275 (R;US)

NAVIER-STOKES EQUATION
See NAVIER-STOKES EQUATIONS

NAVIER-STOKES EQUATIONS
A finite volume element method for the Navier-Stokes equations, 20:22918 (R;FR)
Two-point correlation equations for variable density turbulence, 20:21808 (R;US)

NAVIGATION
Learning to improve path planning performance, 20:21769 (R;US)

NEGATONS
See ELECTRONS

NEGATRONS
See ELECTRONS

NEODYMIUM COMPOUNDS
Problems of synthesis and generating properties of uranium containing inorganic liquid on the basis of phosphorus oxychloride activated with neodymium, 20:21717 (R;RU;In Russian)

NEODYMIUM LASERS
Diode-pumped lasers and amplifiers for photocathode illumination, 20:21950 (RA;US)
Drive lasers and photocathodes for the advanced free electron laser project, 20:21947 (RA;US)
Picosecond laser source with single knob adjustable pulse width, 20:21951 (RA;US)
Temporal dynamics of the multi-frequency spectrum generated by self-phase modulation of two frequencies in single-mode fiber, 20:21848 (R;US)
The Brookhaven Accelerator Test Facility Nd:YAG laser, 20:21949 (RA;US)
The choice: Welding with CO_2 or Nd:YAG lasers, 20:21489 (R;US)
The synchro laser system for the CLIC Test Facility, 20:21946 (RA;US)

NEON 18
Investigation of beta-neutrino angular correlation in super allowed beta-decay of short-lived nuclei, 20:22686 (RA;RU)

NEOPLASMS
Development of new methods of Radiotherapy of neoplasms using neutron beams of the reactors, 20:22365 (IA;RU;In Russian)
Disbursement of $65 million to the State of Texas for construction of a Regional Medical Technology Center at the former Superconducting Super Collider Site, Waxahachie, Texas, 20:22269 (R;US)
Monte Carlo investigations of elastic scattering spectroscopy applied to latex spheres used as tissue phantoms, 20:22366 (R;US)
PEREGRINE: An all-particle Monte Carlo code for radiation therapy, 20:22373 (R;US)
Use of density equalizing map projections (DEMP) in the analysis of childhood cancer in four California counties, 20:22377 (R;US)

NEPA
See US NATIONAL ENVIRONMENTAL POLICY ACT

NEPTUNIUM
Hanford toll irradiation study, 20:21284 (R;US)

NEPTUNIUM 237
Experimental and computational benchmark tests, 20:21221 (RA;US)
Photoabsorption in heavy nuclei at intermediate energies, 20:22734 (IA;RU)

NETWORKS (COMPUTER)
See COMPUTER NETWORKS

NEURAL NETWORKS
Neural network based analysis for chemical sensor arrays, 20:20818 (R;US)
Workshop on environmental and energy applications of neural networks, 20:22957 (R;US)

NEUTRAL-PARTICLE TRANSPORT
Certification of MCNP Version 4A for WHC computer platforms. Revision 7, 20:22770 (R;US)

NEUTRON CAPTURE
See NEUTRON REACTIONS

NEUTRON DENSITY
COREMAP: Graphical user interface for displaying reactor core data in an interactive hexagon map, 20:21234 (R;US)

NEUTRON DETECTORS
See also HE-3 COUNTERS
Calibration of a Modified Californium Shuffler, 20:21605 (R;US)
Neutron scintillators using wavelength shifting fibers, 20:22072 (R;US)

NEUTRON DOSIMETRY
An "exact" treatment of self-shielding and covers in neutron spectra determinations, 20:22103 (R;US)

NEUTRON ECONOMY
See NEUTRON FLUX

NEUTRON FLUX
Interlaboratory Neutron Flux Spectral Measurement Program, 20:21266 (R;US)

NEUTRON FLUX DENSITY
See NEUTRON FLUX

NEUTRON MATTER
See NUCLEAR MATTER

NEUTRON MULTIPLIER FACILITY
See SUBCRITICAL ASSEMBLIES

NEUTRON REACTIONS
Rotation and spin oscillation of high-energy particles in target with polarized nuclei and possibility of measurement of spin-dependent part amplitude of coherent elastic forward scattering, 20:22704 (IA;RU;In Russian)

NEUTRON SLOWING-DOWN THEORY
How many collisions for a neutron in a Tripoli non analogue simulation?, 20:22917 (R;FR)
NEUTRON SOURCE FACILITIES
See also IPNS-I SYNCHROTRON
A low-frequency high-voltage rf-barrier-bunching system for high-intensity neutron source compressor rings, 20:21981 (R;US)
Flow excursion time scales in the advanced neutron source reactor, 20:21296 (R;US)
Linac-driven spallation-neutron source, 20:21866 (R;US)
NEUTRON SOURCES
Lifetime test on a high-performance dc microwave proton source, 20:21979 (R;US)
NEUTRON SPECTROMETERS
Possibilities of improvement of the DIN-2K spectrometric complex performances, 20:22073 (R;RU;In Russian)
NEUTRON STARS
Kaon condensation in dense stellar matter, 20:22521 (R;US)
NEUTRON TRANSPORT THEORY
Heterogeneous treatment in the variational nodal method, 20:21219 (R;US)
How many collisions for a neutron in a Tripoli non analogue simulation?, 20:22917 (R;FR)
NEUTRONS
Energy deposition in a biological submunition warhead by low-yield nuclear interceptors, 20:22150 (R;US)
Low dose neutron late effects: Cataractogenesis. Final progress report, April 1, 1992–March 31, 1993, 20:22402 (R;US)
NEVADA
Record of Decision: Pinon Pine Power Project, Tracy Station, Nevada, 20:21352 (R;US)
NEVADA TEST SITE
1994 Baseline biological studies for the Device Assembly Facility at the Nevada Test Site, 20:22471 (R;US)
ORKNEY: Containment data report, 20:22142 (R;US)
PANAMINT: Containment data report, 20:22140 (R;US)
Untitled article pollution prevention advisor, 20:21354 (R;US)
NEW ENGLAND
See USA
NEW MEXICO
See also LOS ALAMOS
CO_2 Huff-n-Puff process in a light oil shallow shelf carbonate reservoir. 1994 Annual report, 20:20622 (R;US)
Off site demonstrations for MWLID technologies, 20:21521 (R;US)
Structure of the Espanola Basin, Rio Grande Rift, New Mexico, from SAGE seismic and gravity data, 20:22504 (R;US)
NEWTON MECHANICS
See CLASSICAL MECHANICS
NICKEL
Microbial recovery of metals from spent coal liquefaction catalysts. Final report, 20:20541 (R;US)
Printability of substrate and absorber defects on extreme ultraviolet lithographic masks, 20:21593 (R;US)
NICKEL 58 TARGET
Energetic products as pions and high energy protons in heavy ion collisions, evidence for coherent production, 20:22729 (IA;RU)
NICKEL ALLOYS
See also NICKEL BASE ALLOYS
A systematic ALCHEMI study of Fe-doped NiAl alloys, 20:21572 (R;US)
Magnetoresistance behavior of UNiGe, 20:21586 (R;US)
Static displacements of atoms in crystalline metallic solid solutions, 20:21568 (R;US)
Theory of magneto-optics and circular magnetic x-ray dichroism, 20:22785 (R;US)
NICKEL BASE ALLOYS
Electrodeposited tungsten-nickel-boron: A replacement for hexavalent chromium, 20:21599 (R;US)
Melting, casting, and processing of nickel and iron aluminides, 20:21567 (R;US)
Sn-substituted $LaNi_5$ alloys for metal hydride electrodes, 20:21070 (R;US)
NICKEL IODIDES
Charge-transfer gap closure in transition-metal halides under pressure, 20:21658 (R;US)
NICKEL OXIDES
Fundamental studies of the mechanism of catalytic reactions with catalysts effective in the gasification of carbon solids and the oxidative coupling of methane. Quarterly report, October 1, 1994–December 31, 1994, 20:20566 (R;US)
NIOBIUM ALLOYS
High strain rate deformation of Ti-48Al-2Cr-2Nb in the duplex morphology, 20:21584 (R;US)
NIOBIUM CHLORIDES
Metal-insulator phase transitions in the systems with dipole-dipole interaction, 20:21620 (R;RU;In Russian)
NITRATES
See also PETN
PEROXYACETYL NITRATE
Electronic Denitration Savannah River Site Radioactive Waste, 20:20969 (R;US)
K-Area Acid/Caustic Basin groundwater monitoring report. Third quarter 1994, 20:20990 (R;US)
Longwave radiative forcing by aqueous aerosols, 20:22159 (R;US)
Measuring wet deposition in alpine high elevation sites, 20:22278 (IA;DE;In German)
Nitrogen carry-over in mountaineous peatland, 20:22483 (IA;DE;In German)
NITRIC ACID
Disposition and transportation of surplus radioactive low specific activity nitric acid. Volume 2, Environmental Assessment, 20:20976 (R;US)
Disposition and transportation of surplus radioactive low specific activity nitric acid. Volume 1, Environmental Assessment, 20:20975 (R;US)
Transportation impact analysis for the shipment of low specific activity nitric acid. Revisison 1, 20:21037 (R;US)
NITRIC OXIDE
Thermal-grating contributions to degenerate four-wave mixing in nitric oxide, 20:21723 (R;US)
NITROGEN
Atmospheric carry-over of N and absorption of N in spruce stands of Northern Bavaria, 20:22481 (IA;DE;In German)
Effects of nitrogen deposition on nitrate contents in the ground water of forested catchment areas of Bavaria, 20:22347 (IA;DE;In German)
Nitrogen flow in different cultivation systems. A field experiment at Lanna Research Station in south-west Sweden, 20:22331 (R;SE;In Swedish)
The α-induced thick-target γ-ray yield from light elements, 20:22763 (R;US)
NITROGEN DIOXIDE
A study of literature references on the combined effects of ozone and nitrogen dioxide, 20:22491 (R;DK;In Danish)
Energy states and energy flow near the transition states of unimolecular reactions, 20:21710 (R;US)
The detection of mixtures of NO_x's with hydrogen using catalytic metal films on the Sandia Robust Sensor with pattern recognition, 20:21695 (R;US)
NITROGEN NITRIDES
See NITROGEN
NITROGEN OXIDES
See also NITRIC OXIDE
NITROGEN DIOXIDE
NITROUS OXIDE
Advanced hydrogen/methanol utilization technology demonstration. Phase II: Hydrogen cold start of a methanol vehicle, 20:21538 (R;US)
Alternative flue gas treatment technologies for integrated SO_2 and NO_x control, 20:20574 (R;US)
CFCC radiant burner assessment. Final report, April 1, 1992–July 31, 1994, 20:21827 (R;US)
Development and testing of a high efficiency advanced coal combustor: Industrial boiler retrofit, 20:20585 (R;US)

Development of a method for in-cylinder tracking of a fuel additive for NO_x control, 20:21535 (R;US)
Enhancing the use of coals by Gas Reburning: Sorbent injection. [Quarterly report], July 28–October 1, 1993, 20:20587 (R;US)
Enhancing the use of coals by gas reburning-sorbent injection. Volume 2, Gas reburning-sorbent injection at Hennepin Unit 1, Illinois Power Company, 20:20586 (R;US)
Impact of NO_x-emissions from aircraft on ozone chemistry, 20:22231 (RA;NO)
NOx control subsystem test plan: LEBS Phase II, 20:20592 (R;US)
Reactions of NO with a series of peroxy radicals, 20:22218 (RA;NO)
Testing hybrid electric vehicle emissions and fuel economy at the 1994 Hybrid Electric Vehicle Challenge, 20:21530 (R;US)
The detection of mixtures of NO_x's with hydrogen using catalytic metal films on the Sandia Robust Sensor with pattern recognition, 20:21695 (R;US)
Tropospheric nitrogen oxides in the arctic, 20:22225 (RA;NO)

NITROMETHANE
CIST....CORRTEX interferometer simulation test, 20:22133 (R;US)

NITRONIC 40
See STAINLESS STEEL-21-6-9

NITROUS OXIDE
Pyrolysis and combustion of coke from Chalmers fluid bed, 20:20532 (R;DK;In Danish)

NMR
See NUCLEAR MAGNETIC RESONANCE

NOISE (REACTOR)
See REACTOR NOISE

NOISE POLLUTION
Does noise from wind turbines change due to age? Noise generated by gears at Kyndby wind turbine array, 20:21145 (R;DK;In Danish)
Propagation of wind turbine noise. Outline of a prediction method, 20:21147 (R;DK)

NON-EQUILIBRIUM PLASMA
Complexity in plasma. A grand view of self-organization, 20:22859 (R;JP)

NON-INDUCTIVE CURRENT DRIVE
See also LOWER HYBRID CURRENT DRIVE
A comparison of fundamental and second harmonic inside launch ECCD in the presence of a DC electric field, 20:22869 (R;US)

NON-PROLIFERATION POLICY
Draft Environmental Impact Statement on a proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel. Volume 1, 20:21544 (R;US)
Draft environmental impact statement on a proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Volume 2, Appendix G, Background documents, 20:21550 (R;US)
Draft environmental impact statement on a proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Volume 2, Appendix E, Evaluation of human health effects of overland transportation, 20:21549 (R;US)
Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Appendix C, marine transport and associated environmental impacts. Volume 2, 20:21547 (R;US)
Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Appendix A, environmental justice analysis. Volume 2, 20:21545 (R;US)
Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel. Summary, 20:21543 (R;US)
Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Appendix D, selection and evaluation of potential ports of entry. Volume 2, 20:21548 (R;US)
Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Appendix B, foreign research reactor spent nuclear fuel characteristics and transportation casks. Volume 2, 20:21546 (R;US)

NON-PROLIFERATION TREATY
Comparison of chemical and nuclear explosions: Numerical simulations of the Non-Proliferation Experiment, 20:21554 (R;US)
INFCIRC/153 as the basis for verification of a special nuclear materials production cutoff convention, 20:21047 (R;US)
Proceedings of the symposium on the Non-Proliferation Experiment (NPE): Results and implications for test ban treaties, 20:21553 (R;US)

NONDESTRUCTIVE TESTING
CIVA workstation for NDE: mixing of NDE techniques and modeling, 20:21820 (R;FR)
Overview of nondestructive evaluation technologies, 20:21825 (R;US)

NONLINEAR PROBLEMS
The MINPACK-2 test problem collection, 20:22913 (R;US)

NONLINEAR SYSTEMS

OIL SANDS
The extraction of bitumen from western oil sands. Final report, July 1989–September 1993, 20:20726 (R;US)

OIL SHALE WASTE WATER
See WASTE WATER

OIL WELLS

Carbon Dioxide Injection
Anisotropy and spatial variation of relative permeability and lithologic character of Tensleep Sandstone reservoirs in the Bighorn and Wind River basins, Wyoming. Annual report, September 15, 1993–September 30, 1994, 20:20602 (R;US)
Applications of advanced petroleum production technology and water alternating gas injection for enhanced oil recovery - Mattoon Oil Field, Illinois. Final report, 20:20617 (R;US)
CO_2 HUFF-n-PUFF process in a light oil shallow shelf carbonate reservoir. Quarterly technical progress report, [January 1, 1995–March 31, 1995], 20:20623 (R;US)
CO_2 Huff-n-Puff process in a light oil shallow shelf carbonate reservoir. 1994 Annual report, 20:20622 (R;US)
Design and implementation of a CO_2 flood utilizing advanced reservoir characterization and horizontal injection wells in a shallow shelf carbonate approaching waterflood depletion: Project management/evaluation plan, 20:20624 (R;US)
Improved efficiency of miscible CO_2 floods and enhanced prospects for CO_2 flooding heterogeneous reservoirs. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:20619 (R;US)

Caustic Flooding
Investigation of oil recovery improvement by coupling an interfacial tension agent and a mobility control agent in light oil reservoirs. Technical progress report, January–March 1995, 20:20613 (R;US)
Surfactant-enhanced alkaline flooding for light oil recovery. Quarterly report, October 1–December 30, 1994, 20:20612 (R;US)

Directional Drilling
Development of a Near-Bit MWD system, 20:20702 (R;US)
Integrated approach towards the application of horizontal wells to improve waterflooding performance. Annual report, 20:20615 (R;US)
Recovery of bypassed oil in the Dundee formation using horizontal drains. Second quarterly report, [January–March 1995], 20:20620 (R;US)

Fluid Injection
Responsive copolymers for enhanced petroleum recovery. Second annual report, 20:21700 (R;US)

Hydraulic Fracturing
Improved recovery demonstration for Williston Basin carbonates. Quarterly report, January 1, 1995–March 31, 1995, 20:20621 (R;US)

In-Situ Combustion
An evaluation of the benefits of combined steam and fireflooding as a recovery process for heavy oils, 20:20638 (RA;US)
DOE cost-shared in situ combustion projects revisited, 20:20633 (RA;US)
Koch's experience with deep in situ combustion in Williston basin, 20:20644 (RA;US)

Miscible-Phase Displacement
Dispersion measurement as a method of quantifying geologic characterization and defining reservoir heterogeneity. Final report, 20:20610 (R;US)
Scale-up of miscible flood processes for heterogeneous reservoirs. Quarterly report, January 1–March 31, 1995, 20:20611 (R;US)

Mwd Systems
Development of a Near-Bit MWD system, 20:20702 (R;US)

Production
Record of TRC's activities in the fiscal year 1993. Petroleum engineering laboratory, 20:20629 (R;JP;In Japanese)

Steam Injection
An evaluation of the benefits of combined steam and fireflooding as a recovery process for heavy oils, 20:20638 (RA;US)
Reservoir characterization and process monitoring with EM methods. 1994 Annual report, 20:20625 (R;US)

Waste Water
USDOE study: Human health and ecological risk assessment for produced water discharges, 20:20648 (R;US)

Waterflooding
Green River formation water flood demonstration project, Unita Basin, Utah. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:20618 (R;US)
Improved recovery demonstration for Williston Basin carbonates. Quarterly report, January 1, 1995–March 31, 1995, 20:20621 (R;US)
Integrated approach towards the application of horizontal wells to improve waterflooding performance. Annual report, 20:20615 (R;US)
Reservoir characterization and process monitoring with EM methods. 1994 Annual report, 20:20625 (R;US)

Well Drilling
Record of TRC's activities in the fiscal year 1993. Petroleum engineering laboratory, 20:20629 (R;JP;In Japanese)

Well Logging
Recovery of bypassed oil in the Dundee formation using horizontal drains. Second quarterly report, [January–March 1995], 20:20620 (R;US)

OIL-EXPORTING COUNTRIES
Trends of the gulf oil-producing countries, EU, and majors coping with variation in international balance between supply and demand of oil, 20:21419 (R;JP;In Japanese)

Petroleum supply monthly, May 1995 with data for March 1995 (Contains glossary), 20:20650 (R;US)

Cost
Petroleum marketing monthly, May 1995 with data for February 1995, 20:20653 (R;US)

Enhanced Recovery
Enhanced oil recovery using hydrogen peroxide injection, 20:20643 (RA;US)
Improved efficiency of miscible CO_2 floods and enhanced prospects for CO_2 flooding heterogeneous reservoirs. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:20619 (R;US)
Improved sweep efficiency through the application of horizontal well technology in a mature combustion EOR project: Battrum Field, Saskatchewan, Canada, 20:20640 (RA;US)
In situ combustion - from pilot to commercial application, 20:20632 (RA;US)
Naval Petroleum Reserve No. 3 (NPR-3), Teapot Dome Field, Wyoming: Case history of the in situ combustion pilot operation, 20:20642 (RA;US)
Oxygen enriched fireflooding, 20:20631 (RA;US)
Redeeming features of in situ combustion, 20:20630 (RA;US)
Romania - 30 years of experience in in situ combustion, 20:20635 (RA;US)
Shallow oil production using horizontal wells with enhanced oil recovery techniques, 20:20641 (RA;US)
The effect of low-temperature oxidation on the fuel and produced oil during in situ combustion, 20:20636 (RA;US)
The use of air injection to improve the double displacement processes, 20:20639 (RA;US)

Forecasting
Short-term energy outlook: Quarterly projections. Second quarter 1995, 20:21414 (R;US)

Fuel Consumption
Recent hydrocarbon developments in Latin America: Key issues in the downstream oil sector, 20:20655 (R;US)

Global Aspects
Trends of the gulf oil-producing countries, EU, and majors coping with variation in international balance between supply and demand of oil, 20:21419 (R;JP;In Japanese)

In-Situ Combustion
Improved sweep efficiency through the application of horizontal well technology in a mature combustion EOR project: Battrum Field, Saskatchewan, Canada, 20:20640 (RA;US)
In situ combustion - from pilot to commercial application, 20:20632 (RA;US)
In situ combustion field experiences in Venezuela, 20:20634 (RA;US)
Naval Petroleum Reserve No. 3 (NPR-3), Teapot Dome Field, Wyoming: Case history of the in situ combustion pilot operation, 20:20642 (RA;US)
Oxygen enriched fireflooding, 20:20631 (RA;US)
Redeeming features of in situ combustion, 20:20630 (RA;US)
Romania - 30 years of experience in in situ combustion, 20:20635 (RA;US)
Shallow oil production using horizontal wells with enhanced oil recovery techniques, 20:20641 (RA;US)
The effect of low-temperature oxidation on the fuel and produced oil during in situ combustion, 20:20636 (RA;US)

Market
Petroleum marketing monthly, May 1995 with data for February 1995, 20:20653 (R;US)

Oxidation
The effect of low-temperature oxidation on the fuel and produced oil during in situ combustion, 20:20636 (RA;US)

Prices
Short-term energy outlook: Quarterly projections. Second quarter 1995, 20:21414 (R;US)

Production
California energy flow in 1993, 20:21436 (R;US)
Recent hydrocarbon developments in Latin America: Key issues in the downstream oil sector, 20:20655 (R;US)

Refining
Mechanisms for ageing of middle distillates manufactured from crude oils, 20:20674 (RA;US)
The U.S. Department of Energy's Oil Processing Program, 20:20645 (RA;US)
Utilization of the spent caustics generated in the petroleum refineries in the crude distillation unit, 20:20646 (RA;US)

Resource Development
Petroleum and geothermal production technology in Russia: Summary of information obtained during informational meetings with several Russian Institutes, 20:21398 (R;US)

Statistical Data
Petroleum supply annual 1994, Volume 2 (Contains Glossary), 20:20652 (R;US)

Supply and Demand
Petroleum supply monthly, February 1995, with data for December 1994, 20:20649 (R;US)
Short-term energy outlook: Quarterly projections. Second quarter 1995, 20:21414 (R;US)
Trends of the gulf oil-producing countries, EU, and majors coping with variation in international balance between supply and demand of oil, 20:21419 (R;JP;In Japanese)

Thermal Cracking
Comprehensive kinetic models for the aquathermolysis of heavy oils, 20:20637 (RA;US)

Thermal Recovery
Comprehensive kinetic models for the aquathermolysis of heavy oils, 20:20637 (RA;US)
Enhanced oil recovery using hydrogen peroxide injection, 20:20643 (RA;US)

Viscosity
Comprehensive kinetic models for the aquathermolysis of heavy oils, 20:20637 (RA;US)
In situ combustion field experiences in Venezuela, 20:20634 (RA;US)
Record of TRC's activities in the fiscal year 1993. Enhanced recovery laboratory, 20:20628 (R;JP;In Japanese)
Romania - 30 years of experience in in situ combustion, 20:20635 (RA;US)
Shallow oil production using horizontal wells with enhanced oil recovery techniques, 20:20641 (RA;US)

Transient effect in high intensity proton linear accelerators, 20:21923 (R;US)

PROTON BLOCKING
See PROTON CHANNELING

PROTON CHANNELING
Polarization γ-quanta spectrum after π^0-meson decay and channeling in oriented tungsten monocrystals, 20:22797 (IA;RU)

PROTON REACTIONS
Analysis of threshold anomaly in elastic and inelastic proton scattering, 20:22702 (R;RU;In Russian)
Effect of nuclear level density on the calculation of excitation function for production of cesium, xenon, iodine, thallium, lead and bismuth radionuclides, 20:22701 (R;RU;In Russian)
Elastic p-^{4}He scattering at intermediate energies, 20:22710 (IA;RU)
Low energy proton capture in light nuclei. Progress report, September 1, 1993–June 8, 1994, 20:22699 (R;US)
Physics of the (p,p'π) reaction, 20:22733 (IA;RU)

PROTON SOURCES
Lifetime test on a high-performance dc microwave proton source, 20:21979 (R;US)

PROTON-ANTIPROTON INTERACTIONS
An assessment of the antiproton-proton option for the SSC, 20:21885 (R;US)
Comparison of spin asymmetries and cross sections in π^0 production by 200-GeV polarized antiprotons and protons, 20:22604 (IA;RU)
First results for the two-spin parameters A_{LL} in π^0 production by 200 GeV polarized protons and antiprotons, 20:22605 (IA;RU)
High-X_1 single-spin asymmetry in π^0 and η production at X_F=0 by 200-GeV polarized antiprotons and protons, 20:22602 (IA;RU)
Jet shapes at D0 and CDF, 20:22588 (R;US)
Single-spin asymmetry in π+0 production by polarized antiprotons and protons, 20:22597 (IA;RU)
Structure functions of sea quarks, Kogut-Susskind pole and dynamics of pp- and pp-interactions at high energies, 20:22595 (IA;RU)
Supercritical pomerons and spin in pp-scattering, 20:22596 (IA;RU)

PROTON-INDUCED X-RAY EMISSION ANALYSIS
See PIXE ANALYSIS

PROTON-NEUTRON INTERACTIONS
Determination of N N-scattering amplitudes in the energy region from 1.1 to 2.7 GeV and search for a structure around T_{kin} = 2.1 GeV, 20:22612 (RA;RU)
Spin observables in neutron-proton elastic scattering, 20:22623 (IA;RU)
Spin observables in neutron-proton elastic scattering, 20:22614 (RA;RU)
Study of neutron-proton interaction in the 300–700 MeV energy region. Final progress report, July 1991–August 1994, 20:22580 (R;US)

PROTON-PROTON INTERACTIONS
Analysing power measurements in elastic proton-proton scattering at 24 and future measurements at 400 GeV, 20:22607 (IA;RU)
Large-X_F spin asymmetry in π^0 production by 200-GeV polarized protons, 20:22603 (IA;RU)
Measurement of spin observables in pp $\rightarrow$ p K$^+$Y, 20:22611 (RA;RU)
Measuring the gluon polarization from Drell-Yan reactions at large transverse momentum, 20:22593 (IA;RU)
Search for narrow dibaryon resonances in the proton-proton Bremsstrahlung reaction at the energy below the pion threshold, 20:22610 (RA;RU)
Single spin asymmetry in inclusive meson production: What can learn from the high-energy large-X_F data?, 20:22592 (IA;RU)
Single-spin asymmetry in π+0 production by polarized antiprotons and protons, 20:22597 (IA;RU)
Structure functions of sea quarks, Kogut-Susskind pole and dynamics of pp- and pp-interactions at high energies, 20:22595 (IA;RU)
Study of spin effects at 400 to 3000 GeV using an internal jet target at UNK, 20:22617 (RA;RU)
Supercritical pomerons and spin in pp-scattering, 20:22596 (IA;RU)
The experimental study of n p elastic scattering amplitudes at 16 MeV, 20:22613 (RA;RU)

PROTONS
Polarization study of the deuteron photodisintegration reaction in the δ(1232)-resonance region, 20:22707 (IA;RU)
Reaction e p $\rightarrow$ e pγ and proton polarizability, 20:22625 (IA;RU)
Scaling between K$^+$ and proton production in nucleus-nucleus collisions, 20:22691 (R;US)
Study of spin effects at 400 to 3000 GeV using an internal jet target at UNK, 20:22617 (RA;RU)
Testing proton spin models with polarized beams, 20:22652 (IA;RU)

RADIOACTIVE WASTE DISPOSAL
1995 Report on Hanford site land disposal restrictions for mixed waste, 20:20783 (R;US)
A review of the methods used by the US Environmental Protection Agency to assess the financial impacts of the repository regulations, 20:20819 (R;US)
Performance assessment of the direct disposal in unsaturated tuff of spent nuclear fuel and high-level waste owned by USDOE: Volume 2, Methodology and results, 20:20823 (R;US)
Plutonium distribution: Summary of public and governmental support issues, 20:20834 (R;US)
Remedial investigation report on Waste Area Grouping 5 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Volume 4: Appendix C, Risk assessment, 20:21012 (R;US)
Yucca Mountain Site Characterization Project Bibliography, July, December 194: An update, 20:20782 (R;US)
RADIOACTIVE WASTE FACILITIES
See also WIPP
Remotely controlled reagent feed system for mixed waste treatment Tank Farm, 20:20836 (R;US)
Budgets
The Mixed Waste Management Facility, monthly report, February 1995, 20:20827 (R;US)
Construction
Future management of hazardous wastes generated at Brookhaven National Laboratory, Upton, New York. Environmental assessment, 20:20972 (R;US)
Proposed low-level radioactive waste handling building at Fermi National Accelerator Laboratory, Batavia, Illinois, 20:20974 (R;US)
Decommissioning
Successful remediation of four uranium calibration pits at Technical Area II, Sandia National Laboratories, Albuquerque, New Mexico, USA, 20:21027 (R;US)
Design
The Mixed Waste Management Facility monthly report, March 1995, 20:20828 (R;US)
Environmental Impacts
Future management of hazardous wastes generated at Brookhaven National Laboratory, Upton, New York. Environmental assessment, 20:20972 (R;US)
Equipment
Equipment sizing calculations for the Extensive Separations Alternative engineering data package, 20:20892 (R;US)
Fire Hazards
Fire hazard analysis of the radioactive mixed waste trenchs, 20:21042 (R;US)
Fires
A method for estimating ground areas contaminated by a postulated fire in a facility containing radioactive material, 20:20987 (R;US)

Floors
T Plant canyon deck-level allowable floor-load study, 20:21041 (R;US)

Grouting
Grout for closure of the demonstration vault at the US DOE Hanford Facility. Final report, 20:20781 (R;US)

Hydrology
Two-phase flow in regionally saturated fractured rock near excavations, 20:20805 (R;US)

Indoor Air Contamination
Radon concentration and working level in the Exploratory Studies Facility (ESF), 20:20997 (R;US)

Management
The Mixed Waste Management Facility, monthly report, February 1995, 20:20827 (R;US)

Operation
Mined Geologic Disposal System Concept of Operations, 20:20772 (R;US)

Radiation Protection
Project W-320 ALARA Plan, 20:21039 (R;US)

Regulations
Compliance matrix for the mixed waste disposal facilities, trenches 31 and 34, burial ground 218-W-5. Revision 2, 20:20942 (R;US)

Remedial Action
Action-oriented characterization at Argonne National Laboratory, 20:20994 (R;US)
Radiation screening of excavated waste at Hanford's 118-B-1 burial site, 20:21023 (R;US)
Site characterization report for the Old Hydrofracture Facility at Oak Ridge National Laboratory, Oak Ridge, Tennessee, 20:21019 (R;US)

Safety Analysis
Central waste complex interim safety basis, 20:20937 (R;US)

Safety Engineering
Evaluation of HWVP feed preparation chemistry for an NCAW simulant – Fiscal year 1993: Effect of noble metals concentration on offgas generation and ammonia formation, 20:20814 (R;US)

Sampling
Tank 241-BY-108 vapor sampling and analysis tank characterization report. Revision 1, 20:20904 (R;US)

Schedules
The Mixed Waste Management Facility, monthly report, February 1995, 20:20827 (R;US)

Site Characterization
A heated large block test for high level nuclear waste management, 20:20835 (R;US)
Measuring geomechanical properties of Topopah Spring Tuff at the 1-meter scale, 20:20839 (R;US)
Site characterization report for the Old Hydrofracture Facility at Oak Ridge National Laboratory, Oak Ridge, Tennessee, 20:21019 (R;US)

Surface Contamination
Site characterization report for the Old Hydrofracture Facility at Oak Ridge National Laboratory, Oak Ridge, Tennessee, 20:21019 (R;US)

Vapors
Data quality objectives for generic in-tank health and safety vapor issue resolution. Revision 1, 20:20893 (R;US)

Viscosimeters
Viscometer software, Version 1.1, Acceptance test report, 20:20885 (R;US)

Void Fraction
Void fraction instrument software, Version 1,2, Acceptance test report, 20:20884 (R;US)

Volume
Waste volume reduction factors for potential 242-A evaporator feed, 20:20945 (R;US)

RADIOPASTEURIZATION
See RADICIDATION

RADIOPROTECTIVE SUBSTANCES
Antiactinic properties of mineralogic substate, 20:22440 (IA;RU;In Russian)
Application of test of endogeneous spleen colony formation for selection of antiactinic preparations, 20:22441 (IA;RU;In Russian)
Application of vitamins and antioxidants for decreasing mutation frequency induced by gamma radiation, 20:22424 (IA;RU;In Russian)
Modifying effect of radioprotective substances of B-lymphocytes dynamics in mice spleen under irradiation, 20:22421 (IA;RU;In Russian)
Radioprotective and anticarcinogenic activity of glutapyrone under chronic irradiation of mice, 20:22418 (IA;RU;In Russian)
To the problem on radioprotective efficiency of chemical preparations, 20:22416 (IA;RU;In Russian)

RADIORESISTANCE
See RADIOSENSITIVITY

RADIOSENSITIVITY
Effect of thymogen, diethylstilberone and cystamine administration on the indexes of nonspecific resistivity, 20:22417 (IA;RU;In Russian)

RADIOSTERILIZATION
Technological yields of sources for radiation processing, 20:21065 (R;PL;In Polish)

RADIOSURGERY
See SURGERY

RADIUM
Analysis of EPA's cost-effectiveness study for the coastal oil and gas effluent limitations guidelines, 20:20661 (R;US)

RADIUM ADDITIONS
See ALLOYS

RADON 220
Analysis of atmospheric concentrations of radon and thoron using beta counting technique, 20:22195 (R;XA)

RADON 222
Analysis of atmospheric concentrations of radon and thoron using beta counting technique, 20:22195 (R;XA)
Attachment of radon progeny to cigarette-smoke aerosols, 20:22467 (R;US)
Radon concentration and working level in the Exploratory Studies Facility (ESF), 20:20997 (R;US)
Release of radon contaminants from Yucca Mountain: The role of buoyancy driven flow, 20:20764 (R;US)

RADURIZATION
Technological yields of sources for radiation processing, 20:21065 (R;PL;In Polish)

RAHYD PROCESS
See REPROCESSING

RAIL TRANSPORT
The RUF-system, 20:21528 (RA;DK)

RARE EARTHS
See also CERIUM
ERBIUM
GADOLINIUM
HOLMIUM
TERBIUM
4f heavy fermion photoelectron spectra do not exhibit the Kondo scale, 20:22809 (RA;US)

RATS
Effect of interleukine-1 on the recovery of wounds in case of combined radiation injury, 20:22429 (IA;RU;In Russian)
Pacific Northwest Laboratory annual report for 1994 to the DOE Office of Energy Research Part 1: Biomedical sciences, 20:22464 (R;US)

RAYLEIGH-TAYLOR INSTABILITY
Computational and experimental studies of hydrodynamic instabilities and turbulent mixing: Review of VNIIEF efforts. Summary report, 20:21809 (R;US)

RBMK TYPE REACTORS

REACTIVITY WORTHS
Experimental study on sodium void reactivity worth in mockup cores of metallic-fueled and MOX-fueled fast reactors using FCA, 20:21206 (R;JP;In Japanese)

REACTOR ACCIDENTS
See also LOSS OF COOLANT
MELTDOWN
REACTOR CORE DISRUPTION
Hormonal indices in cows with radionuclide injuries of the thyroid, 20:22447 (IA;RU;In Russian)
Selection of risk groups of diseases on the contaminated areas using a new express method-test of P-protein determination in human blood serum, 20:22422 (IA;RU;In Russian)
State of superspiral DNA of lymphocytes and immunity indices of people following 5 years after the actione of factors of radiation accident, 20:22426 (IA;RU;In Russian)
Uranium fuel particles in a rbmk accident. Particle characteristics and atmospheric transport, 20:21192 (RA;FI)
Validation of models using Chernobyl fallout data from the Central Bohemia region of the Czech Republic. Scenario CB. First report of the VAMP Multiple Pathways Assessment Working Group. Part of the IAEA/CEC Co-ordinated Research Programme on the Validation of Environmental Model Predictions (VAMP), 20:21240 (R;XA)

REACTOR CHANNELS
Flow excursion time scales in the Advanced Neutron Source Reactor, 20:21262 (R;US)

REACTOR COMPONENTS
See also BREEDING BLANKETS
FUEL ELEMENTS
REACTOR CHANNELS
REACTOR COOLING SYSTEMS
REACTOR CORES
Key results from the NRC's short cracks in piping and piping welds research program, 20:21182 (RA;US)
Mechanical properties of thermally aged cast stainless steels from Shippingport reactor components, 20:21587 (R;US)
Methods for evaluating nontypical gate valve thrust requirements, 20:21183 (RA;US)
Performance demonstration and personnel qualification for ultrasonic examination in service inspection of nuclear power plants, 20:21823 (R;FI;In Finnish)
Preconceptual ABC design definition and system configuration layout, 20:21207 (R;US)
"PSAD" on-line monitoring and aid to diagnosis workstation: a monitoring tool for EDF power plants, 20:21184 (R;FR;In French)

REACTOR CONTROL THEORY
See REACTOR KINETICS

REACTOR COOLING SYSTEMS
Buoyancy-driven flow excursions in fuel assemblies, 20:21319 (R;US)

REACTOR CORE DISRUPTION
Analysis of core damage frequency: Nuclear power plant Dukovany, VVER/440 V-213 Unit 1, internal events. Volume 1: Main report, 20:21190 (R;US)

REACTOR CORES
Assessment of the SE2-ANL code using EBR-II temperature measurements, 20:21194 (R;US)
CORD-2. Core Design Applications, 20:22934 (CM;SI)
COREMAP: Graphical user interface for displaying reactor core data in an interactive hexagon map, 20:21234 (R;US)
Numerical analysis of the dynamic behaviour of the PEC core by the DINARA code, 20:21204 (RA;XA)

Seismic analysis for PEC fast reactor core experiments using the SAFA program, 20:21201 (RA;XA)
Seismic behaviour of in air MONJU core mock-up - CEA calculation, 20:21205 (RA;XA)

REACTOR FUEL ELEMENTS
See FUEL ELEMENTS

REACTOR FUELING
Status of special reactor process tube loadings, April 1, 1967, 20:21268 (R;US)

REACTOR FUELS
See NUCLEAR FUELS

REACTOR INSTRUMENTATION
Applying neural networks to optimize instrumentation performance, 20:21223 (R;US)
Data processing unit and power system for the LANL REM instrument package. Final report, 20:21237 (R;US)

REACTOR KINETICS
Monte Carlo verification of point kinetics for safety analysis of nuclear reactors, 20:21295 (R;US)

REACTOR MAINTENANCE
Development of maintenance engineering system, 20:21287 (R;JP;In Japanese)

REACTOR MATERIALS
See also NUCLEAR FUELS
Materials considerations for molten salt accelerator-based plutonium conversion systems, 20:21216 (R;US)

REACTOR NOISE
Reactor dynamics experiment of nuclear ship Mutsu using pseudo random signal (III). The third experiment, 20:21208 (R;JP;In Japanese)

REACTOR OPERATION
Probabilistic assessment of dynamic system performance. Part 3, 20:21300 (R;US)

REACTOR OPERATORS
The new generation of information engineering - improved safety when used in nuclear power plants, 20:21307 (IA;DE;In German)

REACTOR PROTECTION SYSTEMS
See also ECCS
Design and testing of integrated circuits for reactor protection channels, 20:21236 (R;US)

REACTOR SAFETY
17. meeting of the Society for Reactor Safety. Proceedings, 20:21305 (I;DE;In German)
Model development for the dynamic analysis of the OSU inherently safe reactor. Part 1, 20:21298 (R;US)
OSART mission highlights 1991-1992. Operational safety practices in nuclear power plants, 20:21174 (R;XA)
Probabilistic assessment of dynamic system performance. Part 3, 20:21300 (R;US)
Reports on research programs in the field of reactor safety sponsored by the Federal Ministry of Research and Technology. Reported period: January 1 to June 30, 1994, 20:21309 (I;DE;In German)
The new generation of information engineering - improved safety when used in nuclear power plants, 20:21307 (IA;DE;In German)
The protective aim concept - a proposal for deterministic safety assessment during periodic in-service inspections of nuclear power plants, 20:21306 (IA;DE;In German)
Twenty-second water reactor safety information meeting: Proceedings. Volume 1: Plenary session; Advanced instrumentation and control hardware and software; Human factors research; IPE and PRA, 20:21313 (R;US)
Twenty-second water reactor safety information meeting: Proceedings. Volume 3: Primary systems integrity; Structural and seismic engineering; Aging research, products and applications, 20:21314 (R;US)

REACTOR SAFETY EXPERIMENTS
Aerosol formation and release rates from heated LWR fuel and control rod simulants, 20:21186 (RA;FI)
Chemical speciation of aerosols formed from heated LWR fuel and control rod simulants, 20:21177 (RA;FI)
Experimental studies on aerosol behaviour in LWR containment conditions, 20:21178 (RA;FI)
KAEVER: experiments on an improved understanding of aerosol behaviour in reactor containments, 20:21176 (RA;FI)
PVC smoke and CsI aerosol mixture in moist atmosphere. An experimental study, 20:21173 (RA;FI)
Report of the 2nd through 7th conferences of Special Committee on Nuclear Criticality Safety, 20:21735 (R;JP;In Japanese)
Stage-II calculations analysis of Italian tests, 20:21202 (RA;XA)

REACTOR SHUTDOWN
Observations and insights from low power and shutdown studies: Grand Gulf Nuclear Power Plant during POS 5 of a refueling outage, 20:21317 (R;US)

REACTOR VESSELS
An interim report on shallow-flaw fracture technology development, 20:21224 (R;US)

REACTORS

Methodology for simultaneous robot system safety design, 20:21510 (R;FI)
Micro-telerobotic applications for microsurgery, 20:22372 (R;US)
Program development of the feature extraction from an intensity image for identifying the location of the mobile robot, 20:21228 (R;JP;In Japanese)
Robotic control architecture development for automated nuclear material handling systems, 20:21776 (R;US)

ROCKGAS PROCESS
See COAL GASIFICATION

ROCKY FLATS PLANT
Actinide solution processing at the Rocky Flats Environmental Technology Site, 20:20779 (R;US)
An improved criticality alarm system, 20:21747 (RA;US)
Determination of plutonium activity levels and $^{240}Pu/^{239}Pu$ isotope ratios in bone collected from nonoccupationally-exposed individuals living in Colorado, 20:22457 (R;US)
Evaluation of residue drum storage safety risks, 20:21025 (R;US)

ROCKY MOUNTAIN REGION
See USA

ROMANIA
Romania - 30 years of experience in in situ combustion, 20:20635 (RA;US)

ROMBACH PROCESS
See COAL GASIFICATION

ROMEO EVENT
See NUCLEAR EXPLOSIONS

ROSENBLUM COUNTERS
See SPARK COUNTERS

ROTORS
A permanent-magnet rotor for a high-temperature superconducting bearing, 20:21326 (R;US)
Application of three dimensional finite element analysis to electron beam welding of a high pressure compressor drum rotor, 20:21768 (R;US)

ROUTING
Traffic congestion forecasting model for the INFORM System. Final report, 20:21480 (R;US)

RUBY LASERS
Laser beaming demonstrations at the Starfire Optical Range, 20:22113 (R;US)

RULISON EVENT
See NUCLEAR EXPLOSIONS
UNDERGROUND EXPLOSIONS

RUMANIA
See ROMANIA

RURAL AREAS
Efficient public transport in rural and low density urban areas, 20:21501 (R;DK;In English, French, German)

RUSSIAN FEDERATION
1995 Protocol for Working Group VIII: Influence of environmental changes on climate. US-Russia agreement on cooperation in the field of protection of the environment and natural resources. Final report, January 1, 1994–December 31, 1994, 20:22169 (R;US)

RUTHENIUM
Metal-ceramic interfaces: Overlayer-induced reconstruction and magnetism of 4d transition-metal monolayers, 20:21574 (R;US)

RUTHENIUM 106 TARGET
See TARGETS
RUTHENIUM 97
Experimental studies for production of some medically important radionuclides: ruthenium-97, tungsten-178, actinium-225, 20:21708 (RA;RU)
RUTHENIUM OXIDES
Structure and properties of heteroepitaxial $Pb(Zr_{0.35}Ti_{0.65})O_3/SrRuO_3$ multilayer thin films on $SrTiO_3(100)$ prepared by MOCVD and RF sputtering, 20:21609 (R;US)
RUTHERFORD SCATTERING
An investigation on the structure of semiconductor hetero interface by RBS and SR SAXS, 20:21685 (IA;JP;In Japanese)
Characterization of single crystalline semiconductors by RBS measurements, 20:21684 (IA;JP;In Japanese)
RWE-BAYERNWERK REACTOR
Mechanical properties of thermally aged cast stainless steels from Shippingport reactor components, 20:21587 (R;US)

S

S CODES
Calculation of the PEC test by the SALCON code, 20:21200 (RA;XA)
SPI/U3.2. Security Profile Inspector for UNIX Systems, 20:22928 (CM;US)
STAR. System for Tracking Applicants and Resumes, 20:22949 (CM;US)
SWTK. Software Tracking Systems, 20:22947 (CM;US)
Verification of MMES five plant criticality software, 20:21737 (RA;US)
S-1000 RESONANCES
See MESONS
SACCHAROMYCES CEREVISIAE
New supporting materials for cell immobilisation. Final report, 20:21078 (R;DE;In German)
SAFETY

REACTOR SAFETY
Cars, energy consumption and safety, 20:21485 (R;DK;In Danish)
SAFETY (NUCLEAR)
See RADIATION PROTECTION
SAFETY (REACTOR)
See REACTOR SAFETY
SAFETY ANALYSIS
RBMK thermohydraulic safety assessments using RELAP5/MOD3 codes, 20:21193 (R;US)
SALEM NUCLEAR GENERATING STATION UNIT-2
See SALEM-2 REACTOR
SALEM-2 REACTOR
Operating experience feedback report – turbine-generator overspeed protection systems: Commercial power reactors. Volume 11, 20:21189 (R;US)
SALINE ZONE
See PICEANCE CREEK BASIN
SALMON
Snake River Sockeye Salmon Sawtooth Valley Project: Conservation & rebuilding program: Supplemental final environmental assessment, 20:21109 (R;US)
SAMARIUM BORIDES
Magnetotransport measurements in magnetic fields up to 50T in SmB_6 and FeSi, 20:22804 (RA;US)
SAMARIUM OXIDES
Methane coupling by membrane reactor, Quarterly technical progress report, September 1994–December 24, 1994, 20:21106 (R;US)
SAMPLERS
See also AIR SAMPLERS
Functional design criteria for the retained gas sampler system, 20:20936 (R;US)
Operability test procedure for the Rotary Mode Core Sampling System Exhausters 3 and 4, 20:20939 (R;US)
Test plan for auger sampler improvements, 20:20949 (R;US)
SAN JUAN POWER PLANT
See FOSSIL-FUEL POWER PLANTS
SANDIA LABORATORIES
Guide to preparing SAND reports. Revision, 20:22975 (R;US)
SANDIA NATIONAL LABORATORIES
See also SANDIA LABORATORIES
Annotated bibliography National Environmental Policy Act (NEPA) documents for Sandia National Laboratories, 20:20822 (R;US)
Research programs at the Department of Energy National Laboratories. Volume 2: Laboratory matrix, 20:21391 (R;US)
SANDSTONES
A method for quantifying the most important mechanisms of acid buffering in carbonate-free soils, 20:22304 (IA;DE;In German)
Anisotropy and spatial variation of relative permeability and lithologic character of Tensleep Sandstone reservoirs in the Bighorn and Wind River basins, Wyoming. Annual report, September 15, 1993–September 30, 1994, 20:20602 (R;US)
Investigation of exfoliation joints in Navajo sandstone at the Zion National Park and in granite at the Yosemite National Park by tectonofractographic techniques, 20:21663 (R;US)
Predicting the transport properties of sedimentary rocks from microstructure, 20:21659 (R;US)
SANITARY LANDFILLS
A new set of direct and iterative solvers for the TOUGH2 family of codes, 20:21812 (R;US)
Field study for disposal of solid wastes from Advanced Coal Processes: Ohio LIMB Site Assessment. Final report, April 1986–November 1994, 20:21163 (R;US)
SASKATCHEWAN
Improved sweep efficiency through the application of horizontal well technology in a mature combustion EOR project: Battrum Field, Saskatchewan, Canada, 20:20640 (RA;US)
SATELLITES
Mars Pathfinder airbag impact attenuation system, 20:21726 (R;US)
SAVANNAH RIVER PLANT
Contamination
An atmospheric tritium release database for model comparisons. Revision 1, 20:20989 (R;US)
Fossil-Fuel Power Plants
Assessment of remaining service life of 1Cr-0.5Mo steam piping, 20:21604 (R;US)
Hazardous Materials
Investigation-Derived Waste Management Plan. Revision 2, 20:20959 (R;US)
Hydrology
F-Area Seepage Basins Groundwater Monitoring Report: Volume 1, Third and fourth quarters 1994, 20:22338 (R;US)
H-Area Seepage Basins Groundwater Monitoring Report: Volume 1, Third and Fourth quarters 1994, 20:22339 (R;US)
Hydrogeologic Setting of A/M Area: Framework for Groundwater Transport. Book 1, 20:22336 (R;US)
Hydrogeologic investigation and establishment of a permanent multi-observational well network in Aiken, Allendale, and Barnwell Counties, South Carolina. Eight-year interim report (1986-1994). Volume 2 core description, 20:22274 (R;US)
Hydrogeologic investigation and establishment of a permanent multi-observational well network in Aiken, Allendale, and Barnwell Counties, South Carolina. Eight-year interim report (1986-1994). Volume 1 cluster-site description, 20:22273 (R;US)
Hydrogeologic settings of A/M Area: Framework for groundwater transport: Book 6, Appendix B, Time/concentration graphs A/M Area monitoring wells, 20:22337 (R;US)
Information Systems
Incorporating bibliographic information into a spatial data query system for the Savannah River Site, 20:22977 (R;US)
Liquid Wastes
Investigation-Derived Waste Management Plan. Revision 2, 20:20959 (R;US)
Magnetic Surveys
Magnetic Survey of K-Area Bingham Pump Outage Pit, 20:20967 (R;US)

Management
Cost quality management assessment for the Savannah River Site. Final report, 20:22904 (R;US)
Operation
SRTC Monthly Report December 1994, 20:20733 (R;US)
Savannah River Plant 100 Area reactors monthly report, April 1956, 20:21264 (R;US)
Savannah River Plant 100 Area reactors monthly report, July 1956, 20:20731 (R;US)
Savannah River Plant 100 Area reactors monthly report, June 1956, 20:20730 (R;US)
Radioactive Waste Management
Design and Fabrication of a Transportable Vitrification System for Mixed Waste Processing, 20:20958 (R;US)
Structural analysis of closure cap barriers: A pre-test study for the Bentonite Mat Demonstration Project, 20:20962 (R;US)
Radioactive Waste Processing
Proposed Site Treatment Plan (PSTP). STP reference document, 20:20965 (R;US)
Radioactive Waste Storage
Cylinder supplied ammonia scrubber testing in IDMS, 20:20963 (R;US)
Evaluating criticality safety of TRU waste with NDA measurements and risk analyses, 20:21746 (RA;US)
Pre-title I safety evaluation for the retrieval operations of transuranic waste drums in the Solid Waste Disposal Facility. Revision 2, 20:20961 (R;US)
Radioactive Wastes
Electronic Denitration Savannah River Site Radioactive Waste, 20:20969 (R;US)
Investigation-Derived Waste Management Plan. Revision 2, 20:20959 (R;US)
Site Characterization
Hydrogeologic investigation and establishment of a permanent multi-observational well network in Aiken, Allendale, and Barnwell Counties, South Carolina. Eight-year interim report (1986-1994). Volume 2 core description, 20:22274 (R;US)
Hydrogeologic investigation and establishment of a permanent multi-observational well network in Aiken, Allendale, and Barnwell Counties, South Carolina. Eight-year interim report (1986-1994). Volume 1 cluster-site description, 20:22273 (R;US)
Stratigraphy
Hydrogeologic investigation and establishment of a permanent multi-observational well network in Aiken, Allendale, and Barnwell Counties, South Carolina. Eight-year interim report (1986-1994). Volume 2 core description, 20:22274 (R;US)
Hydrogeologic investigation and establishment of a permanent multi-observational well network in Aiken, Allendale, and Barnwell Counties, South Carolina. Eight-year interim report (1986-1994). Volume 1 cluster-site description, 20:22273 (R;US)
Waste Management
Test Plan for Methanotrophic Bioreactor at Savannah River Site-TNX, 20:20964 (R;US)
Water Pollution
K-Area Acid/Caustic Basin groundwater monitoring report. Third quarter 1994, 20:20990 (R;US)
SAWTOOTH OSCILLATIONS
Study on sawtooth and transport. A report of Japan-TEXTOR collaboration, 20:22864 (R;JP;In Japanese, English)
SCALAR MESONS
Study of near-threshold charged and neutral meson production in nucleus-nucleus collisions at the delta-installation on Dubna Nuclotron, 20:22732 (IA;RU)
SCANNERS (IMAGE)
See IMAGE SCANNERS
SCANNERS (OPTICAL)
See OPTICAL SCANNERS
SCANNING ELECTRON MICROSCOPY
Scanning tuneling microscopy tip-dependent image contrast of S/Pt(111) by controlled atom transfer, 20:22118 (R;US)
SCANNING LIGHT MICROSCOPY
Soft x-ray scanning microtomography with submicron resolution, 20:22070 (R;US)
SCHMALFELDT-WINTERSHALL PROCESS
See COAL GASIFICATION
SCHOOL FACILITIES

SECURITY PERSONNEL
Smart gun technology requirements preliminary report, 20:21056 (R;US)
SEDIMENTARY ROCKS
See also SANDSTONES
Models of natural fracture connectivity: Implications for Reservoir permeability. Final report for DOE Basic Energy Sciences, 1992, 20:20604 (R;US)
Models of natural fracture connectivity: Implications for reservoir permeability. Annual report for DOE Basic Energy Sciences, 1990, 20:20603 (R;US)

Predicting the permeability of sedimentary rocks from microstructure, 20:21660 (R;US)
Predicting the transport properties of sedimentary rocks from microstructure, 20:21659 (R;US)

SEDIMENTS
Cost effectiveness studies of environmental technologies: Volume 1, 20:21755 (R;US)
IN SITU density measurements oozy bottom of the access channel to the port of Santos, Sao Paulo, Brazil, 20:22262 (R;BR;In Portuguese)

SEEDS
Application of radioactive waste of Kursk NPP reactors as a gamma radiation unit for radiostimulation of seeds in agricultural practice, 20:22388 (IA;RU;In Russian)
Effect of ionizing radiation and microelements on hardness of winter wheat, 20:22431 (IA;RU;In Russian)
Radiation stimulation of formation in sea buckthorn, 20:22386 (IA;RU;In Russian)
Roentgenography method of determining latent injury of seeds and cereals, 20:22389 (IA;RU;In Russian)
Synergetic effect of ionizing radiation and microdements on the seeds of spring wheat, 20:22430 (IA;RU;In Russian)

SEISMIC EVENTS
See also EARTHQUAKES
Intercomparison of liquid metal fast reactor seismic analysis codes. V.1: Validation of seismic analysis codes using reactor core experiments. Proceedings of a research co-ordination meeting held in Vienna, 16-17 November 1993, 20:21196 (R;XA)

SEISMIC SURVEYS
Integration of geophysics within the Argonne expedited site characterization Program at a site in the southern High Plains, 20:22260 (R;US)

SEISMIC WAVES
Can T phases be used to map blockage?, 20:22506 (R;US)

SELENIUM
Cementitious stabilization of chromium, arsenic, and selenium in a cooling tower sludge, 20:20773 (R;US)

SELOX PROCESS
See COAL GASIFICATION

SEM (MICROSCOPY)
See SCANNING ELECTRON MICROSCOPY

SEMICONDUCTOR DEVICES
Development and production of two explosive components using SCB technology, 20:22128 (R;US)
Flip Chip Attach (TRP ARPA No. 3327). Quarterly report, January 1, 1995–March 31, 1995, 20:21832 (R;US)

SEMICONDUCTOR JUNCTIONS
See also HETEROJUNCTIONS
Quantum mechanical capacitance in a scanning tunneling microscope, 20:22112 (R;US)

SEMICONDUCTOR MATERIALS
Modeling of profile effects for the LLNL Large Area Inductively Coupled Plasma Source, 20:21783 (R;US)
Nucleation, propagation, electronic levels and elimination of misfit dislocations in III-V semiconductor interfaces. Final report, 20:22783 (R;US)
Recent results in the devleopment of an integrated EUVL laboratory tool, 20:21671 (R;US)
Surface charge control during high-current ion implantation: Characterization with CHARM-2 sensors, 20:22799 (R;US)

SENSITIVITY ANALYSIS
The adjoint sensitivity method, a contribution to the code uncertainty evaluation, 20:22919 (R;FR)

SEPARATION PROCESSES
See also FILTRATION
FLOTATION
REPROCESSING
Arid sites stakeholder participation in evaluating innovative technologies: VOC-Arid Site Integrated Demonstration, 20:21022 (R;US)
Mixed-conducting ceramic membranes for partial oxygenation of methane, 20:21101 (R;US)

SEQUOYAH NUCLEAR POWER PLANT UNIT-2
See SEQUOYAH-2 REACTOR

SEQUOYAH-2 REACTOR
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 2: Sequoyah Unit 2 Cycle 3, 20:21761 (R;US)

SERI
See NATIONAL RENEWABLE ENERGY LABORATORY

SERUM (BLOOD)
See BLOOD SERUM

SHALE OIL
The development of an integrated multistaged fluid bed retorting process. Technical report, October 1, 1992–December 31, 1992, 20:20727 (R;US)

SHAPED CHARGES
Particulation in jets from free-form hemispherical shaped charges with copper liners, 20:22137 (R;US)

SHEAR PROPERTIES
Sloshing analysis of viscous liquid storage tanks, 20:20760 (R;US)
Sloshing impact in roofed tanks, 20:20761 (R;US)

SHEAR STRENGTH
See SHEAR PROPERTIES

SHEEP
Biological assessment of meat of the irradiated sheep, 20:22453 (IA;RU;In Russian)
Physico-technological qualities of sheep skin following external gamma low dose irradiation of lambs, 20:22451 (IA;RU;In Russian)

SHIELD SUPPORTS
Forty years of mechanization of coal mines, 20:20580 (R;JP;In Japanese)

SHIELDING
Nitrogen system for the SSC, 20:21991 (R;US)

SHIPMENT
See TRANSPORT

SHIPPINGPORT PRESSURIZED WATER REACTOR
See SHIPPINGPORT REACTOR

SHIPPINGPORT REACTOR
Mechanical properties of thermally aged cast stainless steels from Shippingport reactor components, 20:21587 (R;US)

SHOCK ABSORBERS
Snubber reduction analysis of secondary hot leg, 20:21291 (R;US)

SHORT WAVE RADIATION
Comparison of seasonal and zonal patterns of the direct and indirect radiative forcing of climate by aerosols, 20:22161 (R;US)

SHOWER COUNTERS
A 40 GByte/s read-out system for GEM, 20:22049 (R;US)
Conceptual design of the CEM design of the data acquisition system, 20:22036 (R;US)
Detector for C-tau factory of the JINR storage accelerator complex, 20:22091 (RA;RU)
Direct measurement of the branching ratio for the decay of the η-meson into two photons, 20:22086 (RA;RU)
General-purpose pp experiment at the Large Hadron Collider at CERN, 20:22090 (RA;RU)
Resolution measurement of an Interpolating Pad Chamber in the 9 GeV/c π^- beam at BNL, 20:22048 (R;US)
Review of calorimetry in Fermilab fixed-target experiments, 20:22075 (R;US)
Search for the oscillation $\nu_\mu \rightleftarrows \nu_\tau$, 20:22088 (RA;RU)
Solenoidal detector collaboration, 20:22089 (RA;RU)
Study of radiative K-decays with Hyperon spectrometer, 20:22616 (RA;RU)
The Delphi detector (detector with lepton, photon and hadron identification), 20:22087 (RA;RU)

SHUTDOWN (REACTOR)
See REACTOR SHUTDOWN

SI SEMICONDUCTOR DETECTORS
Detection of charged particles and X-rays by scintillator layers coupled to amorphous silicon photodiode arrays, 20:22100 (R;US)
Development of silicon drift detectors for strangeness measurements, 20:22099 (R;US)

Measurement of pulse height defect in silicon surface-barrier detectors. 3, 20:22077 (IA;JP;In Japanese)
Silicon detectors with avalanche intrinsic amplification, 20:22094 (IA;RU)

SIALON
See ALUMINIUM OXIDES
SILICON NITRIDES

SICHROMAL ALLOYS
See ALUMINIUM ALLOYS
CHROMIUM ALLOYS
IRON BASE ALLOYS

SIGMA BARYONS
See also SIGMA PARTICLES
Charmed baryons and spectroscopy at CLEO II, 20:22636 (RA;US)

SIGMA PARTICLES
Preliminary results on the first observation of channeled sigma-hyperon spin precession in bent crystals, 20:22796 (IA;RU)

SIGNAL DISTORTION
Fundamental study of signal processing by optics. Part 3. Non distortion transmission of 2D-information in a fiber using an optical phase conjugator, 20:21490 (R;JP;In Japanese)

SILICA
Laser induced diffusion of ion-implanted bismuth in fused silica, 20:22794 (R;US)

SILICEOUS ROCK
See SANDSTONES

SILICON
Deposition of a-SiC:H, a-SiO_2 and tetrahedral-C with programmable in-situ etching. Final performance report, March 1, 1988–November 30, 1991, 20:21648 (R;US)
Dynamic observation of electrochemical etching in silicon, 20:21664 (R;US)
Final report on LDRD Project: Quantum confinement and light emission in silicon nanostructures, 20:21670 (R;US)
Modeling and simulation of pulsed laser annealing and ablation of solid materials, 20:21644 (R;US)
Planar laser-induced fluorescence imaging of Si and SiO during pulsed laser ablation of Si, 20:21635 (R;US)
Processing and modeling issues for thin-film solar cell devices. Annual subcontract report, January 16, 1994–January 15, 1995, 20:21116 (R;US)
Size, shape, and crystallinity of luminescent structures in oxidized Si nanoclusters and H-passivated porous Si, 20:21661 (R;US)
X-ray absorption spectroscopy from H-passivated porous Si and oxidized Si nanocrystals, 20:21662 (R;US)

SILICON 28 TARGET
Investigation of spin-neutron angular correlations in processes of capture of polarized muons by light nuclei, 20:22716 (RA;RU)
The measurement of nuclear medium effects with K^+, 20:22695 (R;US)

SILICON CARBIDES
Comparison of short and longer term loading on the creep behaviour of alumina-silicon carbide whisker composites, 20:21610 (R;US)
Corrosion performance of materials for advanced combustion systems, 20:20584 (R;US)
Dynamic properties of ceramic materials, 20:21630 (R;US)
Processing and characterization of SiC platelet/SiC composites, 20:21626 (R;US)

SILICON NITRIDES
Corrosion performance of materials for advanced combustion systems, 20:20584 (R;US)
Electron beam joining of structural ceramics, 20:21632 (R;US)
Gas pressure sintering of silicon nitride to optimize fracture toughness, 20:21615 (R;US)
Optimization of the gelcasting of a silicon nitride formulation, 20:21614 (R;US)
Synthesis of silicon nitride powders in pulsed RF plasmas, 20:21633 (R;US)
Transient and steady-state erosion of in-situ reinforced silicon nitride, 20:21607 (R;US)

SILICON OXIDES
See also SILICA
Dynamic properties of ceramic materials, 20:21630 (R;US)
Planar laser-induced fluorescence imaging of Si and SiO during pulsed laser ablation of Si, 20:21635 (R;US)
Solubility behavior of quartz and corundum in supercritical water: A quantitative thermodynamic interpretation, 20:21709 (R;US)

SILICON SEMICONDUCTOR DETECTORS
See SI SEMICONDUCTOR DETECTORS

SILICON SOLAR CELLS
Processing and modeling issues for thin-film solar cell devices. Annual subcontract report, January 16, 1994–January 15, 1995, 20:21116 (R;US)

SILOXANES
Synthesis, characterization and optimization of siloxane polymer coatings for optical sensors based on absorption measurements in the evanescent field, 20:21683 (R;DE;In German)

SILVER
Optical anisotropy of (110) surfaces of Ag and Cu, 20:21582 (R;US)

SIMPLEX PROCESS
See COAL GASIFICATION

SIMS
See MASS SPECTROSCOPY

SINGAPORE
Analysis of industrial pollution prevention programs in selected Asian countries, 20:21347 (R;US)

SINGLE CRYSTALS
See MONOCRYSTALS

SITE CHARACTERIZATION
Mineral nutrition and soil status in spruce forest ecosystems in the Bohemian forest in Upper Austria, 20:22293 (IA;DE;In German)
Site characterization criteria (DOE-STD-1022-94) for natural phenomena hazards at DOE sites, 20:22334 (R;US)

SITE REHABILITATION
See REMEDIAL ACTION

SITE SURVEYS
See SITE CHARACTERIZATION

SKYRMIONS
See SOLITONS

SLAGS
Utilization of lightweight materials made from coal gasification slags. Quarterly report, December 1994–February 1995, 20:20536 (R;US)

SLC
See STANFORD LINEAR COLLIDER

SLIDING FRICTION
Numerical simulation and experimental observations of initial friction transients, 20:21591 (R;US)

SLM
See SCANNING LIGHT MICROSCOPY

SLOWING-DOWN THEORY (NEUTRON)
See NEUTRON SLOWING-DOWN THEORY

SLUDGES
Basis document for sludge stabilization. Revision 1, 20:20858 (R;US)
Cementitious stabilization of chromium, arsenic, and selenium in a cooling tower sludge, 20:20773 (R;US)
Tank 241-BX-103 tank characterization plan, 20:20947 (R;US)

SLURRIES (FUEL)
See FUEL SLURRIES

SMALL ANGLE SCATTERING
An investigation on the structure of semiconductor hetero interface by RBS and SR SAXS, 20:21685 (IA;JP;In Japanese)

SMARTOR DEVICE
See TOKAMAK DEVICES

SMELTING
Computer simulation of gas flow in the flash smelting furnace, 20:21594 (R;FI)
Flow and heat transfer simulation in a flash smelting furnace, 20:21595 (R;FI)

SMOKY EVENT
See NUCLEAR EXPLOSIONS

SNOW
Carry-over from clouds through riming of snow crystals. Contribution to ALPTRAC Project P1a, 20:22188 (IA;DE;In German)

SNPA-DEA PROCESS
See DESULFURIZATION
SODIUM
Experimental study on sodium void reactivity worth in mockup cores of metallic-fueled and MOX-fueled fast reactors using FCA, 20:21206 (R;JP;In Japanese)
Nonlocal stabilized jellium clusters, 20:22777 (R;XA)
Study of oxygen influence on sodium surface tension, 20:21579 (R;RU;In Russian)
The α-induced thick-target γ-ray yield from light elements, 20:22763 (R;US)
SODIUM 32
Three dimensional nuclear magnetic resonance spectroscopic imaging of sodium ions using stochastic excitation and oscillating gradients, 20:22368 (R;US)
SODIUM FLUORIDES
Hanford facilities tracer study report (315 Water Treatment Facility), 20:21036 (R;US)
SODIUM HYDROXIDES
Utilization of the spent caustics generated in the petroleum refineries in the crude distillation unit, 20:20646 (RA;US)
SODIUM IODIDE DETECTORS
See NAI DETECTORS
SODIUM IONS
Three dimensional nuclear magnetic resonance spectroscopic imaging of sodium ions using stochastic excitation and oscillating gradients, 20:22368 (R;US)
SODIUM MINERALS
See MINERALS
SODIUM OXIDES
Electrochemical characterization of orthorhomobic Na_xMnO_2 for alkali metal polymer batteries, 20:21333 (R;US)
SODIUM-SULFUR BATTERIES
Thermal management of batteries using a Variable-Conductance Insulation (VCI) enclosure, 20:21334 (R;US)
SOFC
See SOLID ELECTROLYTE FUEL CELLS
SOILS
Heavy metal migration in soil. An experimental evaluation at two metal recycling industries, 20:22316 (R;DK)
Acid Neutralizing Capacity
A method for quantifying the most important mechanisms of acid buffering in carbonate-free soils, 20:22304 (IA;DE;In German)
Pollutant carry-over and state of the soil in the forests of Baden-Wuerttemberg, 20:22281 (IA;DE;In German)
Acidification
Acid rain and resulting chemical composition of soils, 20:22291 (IA;DE;In German)
Regional estimation models for carry-over of pollutants and forest soil pollution in Southeastern Bavaria, 20:22302 (IA;DE;In German)
Air Pollution Monitoring
Long-term monitoring of polluted forest ecosystems in Bavaria forest climate stations, 20:22174 (IA;DE;In German)
Atmospheric Precipitations
An overview of wet deposition of atmospheric trace pollutants in the Eastern Alpine region, 20:22283 (IA;DE;In German)
Atmospheric deposition in the Erzgebirge, Czech Republic, 20:22300 (IA;DE;In German)
Chemism of wet deposition in the Italian Alps, 20:22280 (IA;DE;In German)
Dry deposition in the Ziller valley, 20:22178 (IA;DE;In German)
Measuring deposition in the forests of western Hungary, 20:22282 (IA;DE;In German)
Austria
Results of the Austrian inventory of the state of forest soils, 20:22285 (IA;DE;In German)
Cesium 134
Natural factors of ^{137}Cs redistribution in soil (case study from the Carpathian Foothills), 20:22309 (R;PL)
Cesium 137
Natural factors of ^{137}Cs redistribution in soil (case study from the Carpathian Foothills), 20:22309 (R;PL)
Cleaning
Demonstrating and implementing innovative technologies: Case studies from the USDOE Office of Technology Development, 20:21397 (R;US)
Contamination
A method for estimating ground areas contaminated by a postulated fire in a facility containing radioactive material, 20:20987 (R;US)
An object-oriented approach to site characterization decision support, 20:20993 (R;US)
Analytical electron microscopy characterization of Fernald soils. Annual report, October 1993–September 1994, 20:22257 (R;US)
Chemical oxidation of volatile and semi-volatile organic compounds in soil, 20:20774 (R;US)
Site characterization report for the Old Hydrofracture Facility at Oak Ridge National Laboratory, Oak Ridge, Tennessee, 20:21019 (R;US)
The Savannah River Environmental Technology Field Test Platform: Phase 2, 20:21045 (R;US)
Uranium characterization at the St. Louis Airport Site, 20:22324 (R;US)
Czech Republic
Changing conditions of soils influences by beech trunk runoff in Slovakia, 20:22290 (IA;DE;In German)
Decontamination
Cost results from the 1994 Fernald characterization field demonstration for uranium-contaminated soils, 20:21020 (R;US)
Deposition
An overview of wet deposition of atmospheric trace pollutants in the Eastern Alpine region, 20:22283 (IA;DE;In German)
Carry-over and dynaymics of pollutants in two small catchment areas in Flysch (Tegernsee Alps), 20:22289 (IA;DE;In German)
Chemism of wet deposition in the Italian Alps, 20:22280 (IA;DE;In German)
Dry deposition in the Ziller valley, 20:22178 (IA;DE;In German)
Measuring deposition in the forests of western Hungary, 20:22282 (IA;DE;In German)
Detoxification
Development of an ultrasonic process for soil remediation, 20:20995 (R;US)
Federal Republic Of Germany
Carry-over and dynaymics of pollutants in two small catchment areas in Flysch (Tegernsee Alps), 20:22289 (IA;DE;In German)
Hungary
Forest soil inventory in Hungary, 20:22288 (IA;DE;In German)
Input-Output Analysis
Critical Loads for forest soils in Middle Europe, 20:22297 (IA;DE;In German)
Italy
Results of a forest soil inventory in Southern Tyrol, 20:22287 (IA;DE;In German)
Lead
Carry-over of lead in the forest soils of northern and western Croatia, 20:22279 (IA;DE;In German)
Nitrogen
Carry-over and turnover of N in forest ecosystems of the Black Forest, 20:22295 (IA;DE;In German)
Experimental studies on increased carry-over of nitrogen in forest soils of the pre-Alpine region (Hoeglwald), 20:22346 (IA;DE;In German)
Nitrogen carry-over in Swiss forest ecosystems and their importance for the nutritional status, 20:22294 (IA;DE;In German)
Permeability
Enhancing in situ bioremediation with pneumatic fracturing, 20:20660 (R;US)
Pollution
Bench- and pilot-scale thermal desorption treatability studies on pesticide-contaminated soils from Rocky Mountain Arsenal, 20:22261 (R;US)
Radioecological Concentration
Radionuclide concentrations in soils and produce from Cochiti, Jemez, Taos, and San Ildefonso Pueblo Gardens, 20:22197 (R;US)

Radionuclide Migration
Studies on sorption behaviour of technetium in soils, 20:22310 (R;JP)
The NPE gas tracer test and the development of on-site inspection techniques, 20:21558 (R;US)
Remedial Action
An object-oriented approach to site characterization decision support, 20:20993 (R;US)
Arid sites stakeholder participation in evaluating innovative technologies: VOC-Arid Site Integrated Demonstration, 20:21022 (R;US)
Bench- and pilot-scale thermal desorption treatability studies on pesticide-contaminated soils from Rocky Mountain Arsenal, 20:22261 (R;US)
Demonstration testing and evaluation of in situ soil heating. Management Plan, Revision 2, 20:21013 (R;US)
Derivation of guidelines for uranium residual radioactive material in soil at the former Baker Brothers, Inc., Site, Toledo, Ohio, 20:20992 (R;US)
Determination of kinetic coefficients for the simultaneous reduction of sulfate and uranium by Desulfovibrio desulfuricans bacteria, 20:21026 (R;US)
Final Report on Testing of Off-Gas Treatment Technologies for Abatement of Atmospheric Emissions of Chlorinated Volatile Organic Compounds, 20:22335 (R;US)
Initial field test of High-Energy Corona process for treating a contaminated soil-offgas stream, 20:22323 (R;US)
Overview of research and development in subsurface fate and transport modeling, 20:20765 (R;US)
Remedial Investigation Work Plan for J-Field, Aberdeen Proving Ground, Maryland, 20:22259 (R;US)
Remedial investigation sampling and analysis plan for J-Field, Aberdeen Proving Ground, Maryland: Volume 2, Quality Assurance Project Plan, 20:22258 (R;US)
Successful remediation of four uranium calibration pits at Technical Area II, Sandia National Laboratories, Albuquerque, New Mexico, USA, 20:21027 (R;US)
Slovakia
Changing conditions of soils influences by beech trunk runoff in Slovakia, 20:22290 (IA;DE;In German)
Soil Chemistry
Critical Loads for forest soils in Middle Europe, 20:22297 (IA;DE;In German)
Stresses
A probabilistic model to liquefaction assessment of dams, 20:22498 (R;US)
Sulfur
Carry-over and turnover of N in forest ecosystems of the Black Forest, 20:22295 (IA;DE;In German)
Surface Contamination
Natural factors of ^{137}Cs redistribution in soil (case study from the Carpathian Foothills), 20:22309 (R;PL)
Switzerland
Results of a pilot study on a Swiss forest soil inventory, 20:22286 (IA;DE;In German)
Water Chemistry
Experimental studies on increased carry-over of nitrogen in forest soils of the pre-Alpine region (Hoeglwald), 20:22346 (IA;DE;In German)
Water Saturation
Using saturation water percentage data to predict mechanical composition of soils, 20:22305 (R;XA)
Weathering
Regional estimation models for carry-over of pollutants and forest soil pollution in Southeastern Bavaria, 20:22302 (IA;DE;In German)

SOLAR BATTERIES
See SOLAR CELL ARRAYS

SOLAR CELL ARRAYS
Technical evaluation of a USSC Integrated/Direct Mount PV Roofing Module system at NREL, 20:21119 (R;US)

SOLAR CELLS

CADMIUM TELLURIDE SOLAR CELLS
COPPER SELENIDE SOLAR CELLS
INDIUM SELENIDE SOLAR CELLS
SILICON SOLAR CELLS
Novel two-stage selenization methods for fabrication of thin-film CIS cells and submodules. Final subcontract report, March 1, 1993–March 31, 1995, 20:21115 (R;US)

SOLAR COLLECTORS
See also FLAT PLATE COLLECTORS
Efficiencies of solar collectors for different tilts. Measurements, 20:21127 (R;DK)
Test results: SEGS LS-2 solar collector, 20:21131 (R;US)

SOLAR CONCENTRATORS
Final project report - CRADA with United Solar Technologies and Pacific Northwest Laboratory (PNL-021): Thin film materials for low-cost high performance solar concentrators, 20:21129 (R;US)

SOLAR ENERGY RESEARCH INSTITUTE
See NATIONAL RENEWABLE ENERGY LABORATORY

SOLAR HEAT ENGINES
Development of a 75-kW heat-pipe receiver for solar heat-engines, 20:21132 (R;US)

SOLAR HEATING SYSTEMS
Development of a multi-function expansion tank, 20:21126 (R;DK;In Danish)
Natural gas/solar heating systems. Market analysis, 20:20724 (R;DK;In Danish)
Solar heating system based on the drain-back principle, 20:21124 (R;DK;In Danish)

SOLAR RADIATION
Aspects of the quality of data from SGP cart site broadband radiation sensors, 20:22158 (R;US)
National Solar Radiation Data Base (1961-1990). Final technical report. Volume 2, 20:22237 (R;US)

SOLAR SPACE HEATING
Analysis of building-integrated solar heating for Globorama. Final report, 20:21125 (R;DK;In Danish)

SOLAR WATER HEATERS
Experimental evaluation of a simulation model for wrap-around heat exchanger, solar storage tanks, 20:21123 (R;US)

SOLID CLUSTERS
Investigation on cluster science, 20:21713 (R;JP;In Japanese)
Investigation on cluster science, 20:21712 (R;JP;In Japanese)
Investigation on cluster science, 20:21713 (R;JP;In Japanese)
Investigation on cluster science, 20:21712 (R;JP;In Japanese)

SOLID ELECTROLYTE FUEL CELLS
Evaluation of the humidification requirements of new proton exchange membranes for fuel cells, 20:21450 (R;US)
Novel solid state proton-conductors based on polymeric non-oxy acids. Final report, 20:21446 (R;US)
Thin-film electrolytes for reduced temperature solid oxide fuel cells, 20:21451 (R;US)

SOLID ELECTROLYTES
Novel solid state proton-conductors based on polymeric non-oxy acids. Final report, 20:21446 (R;US)

SOLID SOLUTIONS
Static displacements of atoms in crystalline metallic solid solutions, 20:21568 (R;US)

SOLID STATE LASERS
See also NEODYMIUM LASERS
RUBY LASERS
A laser system for the TESLA photo-injector, 20:21954 (RA;US)
Gigahertz repetition rate AlGaAs/Ti:Sapphire (LiSAF) mode-locked oscillator/power amplifier laser system for advanced photoinjectors, 20:21945 (RA;US)
The SLAC polarized electron source laser system, 20:21948 (RA;US)

SOLID WASTES
See also WOOD WASTES
High-volume, high-value usage of flue gas desulfurization (FGD) by-products in underground mines: Phase 1, Laboratory investigations. Quarterly report, October–December 1994, 20:20577 (R;US)

Management of dry flue gas desulfurization by-products in underground mines. Quarterly report, October–December 1994, 20:20578 (R;US)

SOLIDIFICATION
A solidification constitutive model for NIKE2D and NIKE3D, 20:21596 (R;US)
New pellet production and acceleration technologies for high speed pellet injection system 'HIPEL' in large helical device, 20:22885 (R;JP)

SOLIDS
45-Day safety screen results for tank 241-C-105, push mode, cores 72 and 76, 20:20887 (R;US)
45-Day safety screen results for tank 241-U-202, push mode, cores 75 and 78, 20:20889 (R;US)
Analysis of interaction phenomena between liquid jets and materials. Revision 1, 20:21779 (R;US)

SOLIDS FLOW
Nuclear mgnetic resonance study of granular flows. Final report, 20:20581 (R;US)

SOLITONS
Potential motion for Thomas-Fermi non-topological solitons, 20:22663 (R;US)

SOLUTES
SAMFT1D: Single-phase and multiphase flow and transport in 1 dimension. Version 2.0, Documentation and user's guide, 20:22311 (R;US)

SOLUTIONS

Monte Carlo investigations of elastic scattering spectroscopy applied to latex spheres used as tissue phantoms, 20:22366 (R;US)
Radiation screening of excavated waste at Hanford's 118-B-1 burial site, 20:21023 (R;US)

SPENT FUEL CASKS
AUTOCASK (AUTOmatic Generation of 3-D CASK models). A microcomputer based system for shipping cask design review analysis, 20:21758 (R;US)
Buckling analysis of spent fuel basket, 20:21759 (R;US)
Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Appendix B, foreign research reactor spent nuclear fuel characteristics and transportation casks. Volume 2, 20:21546 (R;US)
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 1: Summary, 20:21760 (R;US)
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 2: Sequoyah Unit 2 Cycle 3, 20:21761 (R;US)
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 3: Surry Unit 1 Cycle 2, 20:21762 (R;US)
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 4: Three Mile Island Unit 1 Cycle 5, 20:21763 (R;US)

SPENT FUEL ELEMENTS
Draft environmental impact statement on a proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Volume 2, Appendix G, Background documents, 20:21550 (R;US)
Draft environmental impact statement on a proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Volume 2, Appendix E, Evaluation of human health effects of overland transportation, 20:21549 (R;US)

SPENT FUEL STORAGE
Environmental evaluations in the Multi-Purpose Canister Environmental Impact Statement, 20:20758 (R;US)
Evaluation of residue drum storage safety risks, 20:21025 (R;US)
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 1: Summary, 20:21760 (R;US)
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 2: Sequoyah Unit 2 Cycle 3, 20:21761 (R;US)
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 3: Surry Unit 1 Cycle 2, 20:21762 (R;US)

SCALE-4 analysis of pressurized water reactor critical configurations. Volume 4: Three Mile Island Unit 1 Cycle 5, 20:21763 (R;US)

SPENT FUELS

Benchmarks
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 1: Summary, 20:21760 (R;US)
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 2: Sequoyah Unit 2 Cycle 3, 20:21761 (R;US)
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 3: Surry Unit 1 Cycle 2, 20:21762 (R;US)
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 4: Three Mile Island Unit 1 Cycle 5, 20:21763 (R;US)

Chemical Properties
Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Appendix B, foreign research reactor spent nuclear fuel characteristics and transportation casks. Volume 2, 20:21546 (R;US)

Control Systems
Proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Appendix D, selection and evaluation of potential ports of entry. Volume 2, 20:21548 (R;US)

Corrosion
Alteration of spent fuel matrix under unsaturated water conditions, 20:20750 (R;US)
Hydrogen Gas Generation from Mark 31 Slugs, 20:20744 (R;US)

Criticality
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 1: Summary, 20:21760 (R;US)
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 2: Sequoyah Unit 2 Cycle 3, 20:21761 (R;US)
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 3: Surry Unit 1 Cycle 2, 20:21762 (R;US)
SCALE-4 analysis of pressurized water reactor critical configurations. Volume 4: Three Mile Island Unit 1 Cycle 5, 20:21763 (R;US)

Electrorefining
Script for Argonne lithium process video, 20:21561 (R;US)

Environmental Impact Statements

SULFURIC ACID
Novel nanodispersed coal liquefaction catalysts: Molecular design via microemulsion-based synthesis. Technical progress report, January 1992–March 1992, 20:20548 (R;US)

SULFURYL COMPOUNDS
Subthreshold diagnostics and features of uranium-containing laser-active liquid on the basis of sulfuryl, 20:21719 (R;RU;In Russian)

SUM RULES
N_c behavior of the Adler-Weisberger sum rule, 20:22654 (IA;RU)

SUPERCOMPUTERS
Users guide to the Argonne SP scheduling system, 20:22914 (R;US)

SUPERCONDUCTING CABLES
Constant of thermal heat conduction and stabilization of the bus bar conductor for superconducting accelerators, 20:22037 (R;US)

SUPERCONDUCTING CAVITY RESONATORS
Advanced electromagnetic design of cavities for high current accelerators, 20:21977 (R;US)
Test results for a heat-treated 4-cell 805 MHz superconducting cavity, 20:21976 (R;US)

SUPERCONDUCTING COILS
Interstrand resistance of SSC magnets, 20:22047 (R;US)

SUPERCONDUCTING JUNCTIONS
Non-equilibrium dynamics in superconducting tunnel junction detectors, 20:22108 (R;US)

SUPERCONDUCTING MAGNETS
Superconducting magnets, cryostats, and cryogenics for the interaction region of the SSC, 20:22044 (R;US)

Accelerators
Superconducting magnets for particle large accelerators, 20:21961 (R;FR;In French)
Beam Focusing Magnets
Final focus system with superconducting magnets in the interaction region of the TESLA linear collider, 20:21962 (R;FR)
C Codes
COOLWARM. Magnet Cooldown and Warmup Model, 20:22940 (CM;US)
Computerized Tomography
Advances in the use of tomographic inspection techniques for non-destructive analysis of geometric conductor position and correlation with magnetic cross-section modeling, 20:22031 (R;US)
Configuration
Report of the workshop on realistic SSC lattices, 20:21883 (R;US)
Construction
Construction and testing of arc dipoles and quadrupoles for the relativistic heavy ion collider (RHIC) at BNL, 20:22054 (R;US)
Field quality control through the production phase of RHIC arc dipoles, 20:21956 (R;US)
Superconducting sextupoles and trim quadrupoles for RHIC, 20:21955 (R;US)
Cooling
XFLOW. Crossflow Cooling Analysis Program, 20:22942 (CM;US)
[Fluid dynamics of supercritical helium within internally cooled cabled superconductors. Annual report], 20:22876 (R;US)
Cost Benefit Analysis
Cost comparisons for SSC magnet dependent systems, 20:21882 (R;US)
Cryogenic Fluids
Activation of the liquid helium contamination during its passage in the Collider ring, 20:22015 (R;US)
Design
Design of a 16T Nb_3Sn twin dipole with a window-frame conductor layout, 20:21984 (R;US)
Field quality control through the production phase of RHIC arc dipoles, 20:21956 (R;US)
Electric Currents
A model for local current decay in a superconducting LR chain, 20:22009 (R;US)
Evaluation
Status of superconducting magnets for the Superconducting Super Collider, 20:22042 (R;US)
Fabrication
Fabrication and component testing results for a Nb_3Sn dipole magnet, 20:21982 (R;US)
Heat Transfer
COOLWARM. Magnet Cooldown and Warmup Model, 20:22940 (CM;US)
Final report on fluid dynamics of supercritical helium within cable-in-conduit conductors, 20:22877 (R;US)
Linear Colliders
Final focus system with superconducting magnets in the interaction region of the TESLA linear collider, 20:21962 (R;FR)
Magnetic Fields
Industrial harmonic analysis system for magnetic measurements of SSC collider arc and high energy booster corrector magnets, 20:22039 (R;US)
Performance Testing
Construction and testing of arc dipoles and quadrupoles for the relativistic heavy ion collider (RHIC) at BNL, 20:22054 (R;US)
Heat leak performance of SSC collider dipole magnets, 20:22043 (R;US)
Ramp-rate sensitivity of SSC dipole magnet prototypes, 20:22050 (R;US)
Polarized Beams
Snake for POLEX, 20:21975 (IA;RU)
Power Systems
Equipment acquisition plans for the SSCL magnet excitation power system, 20:22030 (R;US)
Production
Combined element magnet production for the relativistic heavy ion collider (RHIC) at BNL, 20:21957 (R;US)
Quality Control
A comparison of least squares linear regression and measurement error modeling of warm/cold multipole correlation in SSC prototype dipole magnets, 20:22029 (R;US)
Quenching
A quench detection/logging system for the SSCL Magnet Test Laboratory, 20:22033 (R;US)
Quench performance of 50-mm aperture, 15-m-long SSC dipole magnets built at Fermilab, 20:22022 (R;US)
Superconducting sextupoles and trim quadrupoles for RHIC, 20:21955 (R;US)
Radiation Detection
Superconducting magnets for particle large accelerators, 20:21961 (R;FR;In French)
Spacers
Design and fabrication of end spacers for a 13T Nb_3Sn dipole magnet, 20:21983 (R;US)
Static Loads
Bulk Modulus Capacitor Load Cells, 20:22007 (R;US)
Stress Analysis

TANKER SHIPS
Environmental requirements to tanker ships - effect on market and competition situation (Aalborg Univesity Centre), 20:21363 (RA;DK;In Norwegian)

TANKS
Acoustic Testing
A parametric study of double-shell tank response to internal high-frequency pressure loading, 20:20851 (R;US)
Work plan for the identification of techniques for in-situ sensing of layering/interfaces of Hanford high level waste tanks, 20:20954 (R;US)
Aging
An overview of the DOE high-level waste storage tank structural integrity assessment guidelines, 20:20766 (R;US)
Construction
Project W-236A multi-function waste tank facility waste feed projections, 20:20877 (R;US)
Corrosion
Limits on Annulus Air Outages in Types 1, 2, and 3 Waste Tanks, 20:20970 (R;US)
Meier associates and Pacific Northwest Laboratory staff exchange: Transfer of corrosion monitoring expertise to assess and develop in-line inspection tools for corrosion control, 20:22119 (R;US)
Corrosion Protection
Acceptance Test Procedure for Cathodic Protection, Rectifier 11, 20:20868 (R;US)
Functional design criteria SY tank farm cathodic protection, 95G-EWW-430, 20:20880 (R;US)
Corrosion Resistance
Laboratory studies of gas generation and potential for tank wall corrosion during blending of high-level wastes at the West Valley Demonstration Project, 20:20817 (R;US)
Drill Cores
45-Day safety screen results for tank 241-U-203, push mode, cores 79 and 80, 20:20888 (R;US)
Electric Motors
System design description for the HMT Rotation Motor Heater System, 20:20943 (R;US)
Embrittlement
Limits on Annulus Air Outages in Types 1, 2, and 3 Waste Tanks, 20:20970 (R;US)
Engineered Safety Systems
Safety equipment list, 20:20870 (R;US)
Evaporators
242-A Control System device logic software documentation. Revision 2, 20:20857 (R;US)
Gas Analysis
Functional design criteria for the retained gas sampler system, 20:20936 (R;US)
Vapor space characterization of waste tank 241-BY-105 (in situ): Results from samples collected on May 9, 1994, 20:20816 (R;US)
Mechanical Structures
An overview of the DOE high-level waste storage tank structural integrity assessment guidelines, 20:20766 (R;US)
Monitoring
45-Day safety screen results for tank 241-C-105, push mode, cores 72 and 76, 20:20887 (R;US)
45-Day safety screen results for tank 241-U-202, push mode, cores 75 and 78, 20:20889 (R;US)
A parametric study of double-shell tank response to internal high-frequency pressure loading, 20:20851 (R;US)
Chemometrics review for chemical sensor development, task 7 report, 20:20780 (R;US)
Laboratory studies of gas generation and potential for tank wall corrosion during blending of high-level wastes at the West Valley Demonstration Project, 20:20817 (R;US)
Tank 241-BY-104 vapor sampling and analysis tank characterization report. Revision 1, 20:20899 (R;US)
Tank 241-BY-105 vapor sampling and analysis tank characterization report. Revision 1, 20:20900 (R;US)
Tank 241-BY-106 vapor sampling and analysis tank characterization report. Revision 1, 20:20901 (R;US)
Tank 241-BY-107 vapor sampling and analysis tank characterization report, 20:20902 (R;US)
Tank 241-BY-107 vapor sampling and analysis tank characterization report. Revision 1, 20:20903 (R;US)
Tank 241-BY-111 vapor sampling and analysis tank characterization report, 20:20915 (R;US)
Tank 241-BY-112 vapor sampling and analysis tank characterization report, 20:20916 (R;US)
Tank 241-C-104 vapor sampling and analysis tank characterization report, 20:20917 (R;US)
Tank 241-C-108 vapor sampling and analysis tank characterization report. Revision 1, 20:20906 (R;US)
Tank 241-C-112 vapor sampling and analysis tank characterization report. Revision 1, 20:20910 (R;US)
Tank 241-S-102 vapor sampling and analysis tank characterization report, 20:20921 (R;US)
Tank 241-SX-115 tank characterization plan, 20:20946 (R;US)
Tank 241-TX-105 vapor sampling and analysis tank characterization report, 20:20923 (R;US)
Tank 241-TX-118 vapor sampling and analysis tank characterization report, 20:20924 (R;US)
Tank 241-U-107 vapor sampling and analysis tank characterization report, 20:20925 (R;US)
Tank 241-U-111 vapor sampling and analysis tank characterization report, 20:20926 (R;US)
Using tank 107-AN caustic addition for confirmation of mixing scale relationship, 20:20874 (R;US)
Vapor space characterization of waste tank 241-BY-105 (in situ): Results from samples collected on May 9, 1994, 20:20816 (R;US)
Vapor space characterization of waste tank 241-BY-105: Results from samples collected on 7/7/94, 20:20815 (R;US)
Work plan for the identification of techniques for in-situ sensing of layering/interfaces of Hanford high level waste tanks, 20:20954 (R;US)
Procurement
Pump strongback re-design, pump storage, PM procedures, 20:20934 (R;US)
Pumps
Using tank 107-AN caustic addition for confirmation of mixing scale relationship, 20:20874 (R;US)
Radioactive Waste Storage
Performance benefits of telerobotics and teleoperation - enhancements for an arm-based tank waste retrieval system, 20:20824 (R;US)
Remedial Action

TUFF
A heated large block test for high level nuclear waste management, 20:20835 (R;US)

A progress report for the large block test of the coupled thermal-mechanical-hydrological-chemical processes, 20:20982 (R;US)
Alteration of spent fuel matrix under unsaturated water conditions, 20:20750 (R;US)
Applications of TOUGH2 to infiltration of liquids in media with strong heterogeneity, 20:20806 (R;US)
Colloid-facilitated radionuclide transport at Yucca Mountain, 20:20789 (R;US)
Hydrological property measurements of Topopah Spring Tuff (Yucca mountain project), 20:20832 (R;US)
Measuring geomechanical properties of Topopah Spring Tuff at the 1-meter scale, 20:20839 (R;US)
Plutonium carbonate speciation changes as measured in dilute solutions with photoacoustic spectroscopy: Yucca Mountain Site Characterization Program Milestone report 3350 (Yucca mountain project), 20:20790 (R;US)
Progress report on pre-test calculations for the large block test, 20:20831 (R;US)
The large block test, a progress report, 20:20838 (R;US)

TUMORS
See NEOPLASMS

TUNGSTEN
A cross section measurement of charm hyperons Ξ_c^+ and Ξ_c^0 in 250 GeV p/K/π-nucleon interactions, 20:22698 (R;US)

TUNGSTEN 178
Experimental studies for production of some medically important radionuclides: ruthenium-97, tungsten-178, actinium-225, 20:21708 (RA;RU)

TUNGSTEN ALLOYS
Electrodeposited tungsten-nickel-boron: A replacement for hexavalent chromium, 20:21599 (R;US)

TUNGSTEN CARBIDES
Dynamic properties of ceramic materials, 20:21630 (R;US)
Machinability study of Aermet 100, 20:21598 (R;US)
Researches on tungsten carbide, 20:21619 (R;JP;In Japanese)

TURBINE BLADES
Experimental determination of stiffness distributions and mode shapes of wind turbines blades, 20:21148 (R;DK)

TURBOGENERATORS
Operating experience feedback report – turbine-generator overspeed protection systems: Commercial power reactors. Volume 11, 20:21189 (R;US)

TURBULENCE
Complexity in plasma. A grand view of self-organization, 20:22859 (R;JP)
Turbulence and spatio-temporal chaos. Final Report, 20:22520 (R;US)
Two-point correlation equations for variable density turbulence, 20:21808 (R;US)

TURBULENT FLOW
A thermodynamical formulation for chemically active multiphase turbulent flows, 20:21711 (R;US)
Analysis and modeling of small-scale turbulence in the near-wall region of turbulent shear flows, 20:21795 (R;DE;In German)
Numerical investigation of flows and heat exchange in tubes with use of (k-ϵ) turbulence model, 20:21799 (R;RU;In Russian)
[Fluid dynamics of supercritical helium within internally cooled cabled superconductors. Annual report], 20:22876 (R;US)

TURTLES
1994 Baseline biological studies for the Device Assembly Facility at the Nevada Test Site, 20:22471 (R;US)

TVO-1 REACTOR
The effects of the Olkiluoto nuclear power plant on the infrastructure and the economy of the region, 20:21217 (R;FI;In Finnish)

TVO-2 REACTOR
The effects of the Olkiluoto nuclear power plant on the infrastructure and the economy of the region, 20:21217 (R;FI;In Finnish)

TWO-PHASE FLOW
A behavior of helium gas bubble in NaK-78 pool with a magnetic field, 20:21800 (IA;JP;In Japanese)
A thermodynamical formulation for chemically active multiphase turbulent flows, 20:21711 (R;US)
Analyses of liquid-gas two-phase flow in fermentation tanks, 20:21804 (IA;JP;In Japanese)
Dependence of void distribution in bubbly flow on rod arrays inclination angle, 20:21802 (IA;JP;In Japanese)
Measuring method of liquid flow behavior using visualization, 20:21806 (IA;JP;In Japanese)
Phase distribution of air-water two-phase flow across inclined tube bundle, 20:21805 (IA;JP;In Japanese)
Quantitative characterizations of phasic structure developments by local measurement methods in two-phase flow, 20:21794 (R;US)
Visualization of physical informations derived from numerical calculation, 20:21807 (IA;JP;In Japanese)

Undulators for short wavelength FEL amplifiers, 20:21985 (R;US)

WILD ANIMALS
Hellsgate Winter Range: Wildlife Mitigation Project. Final Environmental Assessment, 20:21110 (R;US)
Wildlife studies on the Hanford site: 1994 Highlights report, 20:22326 (R;US)
Willow Creek Wildlife Mitigation Project. Final environmental assessment, 20:22267 (R;US)

WILDERNESS AREAS
See NATURE RESERVES

WILLISTON BASIN
Koch's experience with deep in situ combustion in Williston basin, 20:20644 (RA;US)

WILPUTTE PROCESS
See COAL GASIFICATION

WIND ENERGY CONVERSION SYSTEMS
See WIND TURBINES

WIND FARMS
See WIND TURBINE ARRAYS

WIND GENERATORS
See WIND TURBINES

WIND POWER
Description and evaluation of foreign wind turbine technology, 20:21143 (R;DK;In Danish)
Proposed Columbia Wind Farm #1. Joint NEPA/SEPA draft environmental impact statement, 20:21144 (R;US)
Wind energy bibliography, 20:20600 (R;US)

WIND POWER PLANTS
Proceedings of National Avian-Wind Power Planning Meeting, Lakewood, Colorado, July 20-21, 1994, 20:21151 (R;US)
Proposed Columbia Wind Farm #1. Joint NEPA/SEPA draft environmental impact statement, 20:21144 (R;US)

WIND TURBINE ARRAYS
All wind farm uncertainty is not the same: The economics of common versus independent causes, 20:21150 (R;US)

WIND TURBINES
See also HORIZONTAL AXIS TURBINES
Does noise from wind turbines change due to age? Noise generated by gears at Kyndby wind turbine array, 20:21145 (R;DK;In Danish)
Experimental determination of stiffness distributions and mode shapes of wind turbines blades, 20:21148 (R;DK)
Propagation of wind turbine noise. Outline of a prediction method, 20:21147 (R;DK)
Report on measurements taken on Nibe windmill A, which is fitted with wooden blades. Measuring period 1991 - 1993, 20:21146 (R;DK;In Danish)
Wind energy bibliography, 20:20600 (R;US)

WINDOWS
From the lab to the marketplace: Making America's buildings more energy efficient, 20:21470 (R;US)
Measurement of bidirectional optical properties of complex shading devices, 20:21466 (R;US)
NFRC efforts to develop a residential fenestration annual energy rating methodology, 20:21467 (R;US)

WIPP
A new set of direct and iterative solvers for the TOUGH2 family of codes, 20:21812 (R;US)
Laboratory measurements of gas flow along a pressurized grout/membrane/halite interface for the Waste Isolation Pilot Plant, 20:20820 (R;US)
Waste Isolation Pilot Plant borehole data, 20:20786 (R;US)
Waste Isolation Pilot Plant remote-handled transuranic waste disposal strategy, 20:20785 (R;US)

WOLFRAM
See TUNGSTEN

WOOD
Reactions of fuel bound nitrogen in gasification processes, 20:20570 (R;FI)

WOOD ALCOHOL
See METHANOL

WOOD BURNING APPLIANCES
Greenhouse gas emissions from wood stoves, 20:21095 (RA;NO)

WOOD FUELS
Combustion of polluted waste wood. Investigation of environmentally pollutive substances issuing from waste incineration plants with or without the addition of polluted waste wood to the volume of waste, 20:21081 (R;DK;In Danish)
Combustion of polluted waste wood. Phase 1: Report on literature, 20:21082 (R;DK;In Danish)

WOOD STOVES
See WOOD BURNING APPLIANCES

WOOD WASTES
Combustion of polluted waste wood. Investigation of environmentally pollutive substances issuing from waste incineration plants with or without the addition of polluted waste wood to the volume of waste, 20:21081 (R;DK;In Danish)
Combustion of polluted waste wood. Phase 1: Report on literature, 20:21082 (R;DK;In Danish)

WOOD-FUEL POWER PLANTS
Pressurized biomass combustion with respect of wood fuel, 20:21098 (RA;NO)

WORKERS
See PERSONNEL

WOUNDS
Effect of interleukine-1 on the recovery of wounds in case of combined radiation injury, 20:22429 (IA;RU;In Russian)

WWER-3 REACTOR
Evaluation of single failure effects during loss of coolant accidents for a VVER-440 reactor, 20:21292 (R;US)

WWER-440 REACTOR
See WWER-3 REACTOR

WYOMING
Anisotropy and spatial variation of relative permeability and lithologic character of Tensleep Sandstone reservoirs in the Bighorn and Wind River basins, Wyoming. Annual report, September 15, 1993–September 30, 1994, 20:20602 (R;US)
Naval Petroleum Reserve No. 3 (NPR-3), Teapot Dome Field, Wyoming: Case history of the in situ combustion pilot operation, 20:20642 (RA;US)

X

X CODES
Verification of MMES five plant criticality software, 20:21737 (RA;US)
XDAMP. Experimental Time-Dependent Data Analysis, Manipulation, Visualization GUI, 20:22933 (CM;US)
XDELAY. FPGA ROM Code for Very Large FIFO Control, 20:22930 (CM;US)
XFLOW. Crossflow Cooling Analysis Program, 20:22942 (CM;US)

X RADIATION
Theory of magneto-optics and circular magnetic x-ray dichroism, 20:22785 (R;US)

X-2830 RESONANCES
See MESONS

X-RASERS
See X-RAY LASERS

X-RAY DIFFRACTION
X-ray Raman scattering in H-BN observed by soft x-ray fluorescence spectroscopy, 20:22772 (R;US)

X-RAY LASERS
Impact of three-dimensional nonuniformity on the germanium x-ray laser output, 20:21851 (R;US)
Multiple pulse traveling wave excitation of neon-like germanium, 20:21849 (R;US)

X-RAY SOURCES
A low emittance lattice for the NSLS X-Ray Ring, 20:21959 (R;US)
Design, simulation and visualization of ultrafast electron optical devices, 20:21893 (RA;US)
Overall design concepts for the APS storage ring machine protection system, 20:21855 (R;US)
Soft x-ray scanning microtomography with submicron resolution, 20:22070 (R;US)

X-RAY SPECTROMETERS
Low-energy response of superconducting tunnel junction x-ray spectrometers, 20:22107 (R;US)

XENON IONS
Measurements of cross sections and resonance structures following electron-impact excitation/ionization of Na-like Kr and Xe, 20:22775 (R;US)

XENON ISOTOPES
Effect of nuclear level density on the calculation of excitation function for production of cesium, xenon, iodine, thallium, lead and bismuth radionuclides, 20:22701 (R;RU;In Russian)

XI BARYONS
See also XI PARTICLES
Charmed baryons and spectroscopy at CLEO II, 20:22636 (RA;US)

XI C PLUS BARYONS
A cross section measurement of charm hyperons Ξ_c^+ and Ξ_c^0 in 250 GeV p/K/π-nucleon interactions, 20:22698 (R;US)
Fermilab fixed target charm program, 20:22638 (RA;US)

XI MINUS
See XI MINUS PARTICLES

XI MINUS PARTICLES
A cross section measurement of charm hyperons Ξ_c^+ and Ξ_c^0 in 250 GeV p/K/π-nucleon interactions, 20:22698 (R;US)

XI NEUTRAL
See XI NEUTRAL PARTICLES

XI NEUTRAL PARTICLES
A cross section measurement of charm hyperons Ξ_c^+ and Ξ_c^0 in 250 GeV p/K/π-nucleon interactions, 20:22698 (R;US)

XI PARTICLES
See also XI MINUS PARTICLES
XI NEUTRAL PARTICLES
Charm physics – The theory case for a new generation of experiments, 20:22634 (RA;US)

XI-MINUS
See XI MINUS PARTICLES

XI-NEUTRAL
See XI NEUTRAL PARTICLES

Y

Y*RESONANCES
See BARYONS

Y-12 PLANT
Department of Energy refurbish power supply/distribution system: Phase 2, Y-12 Plant, Oak Ridge. Project status report No. 40, December 1–31, 1994, 20:21321 (R;US)

YANKEE EVENT
See NUCLEAR EXPLOSIONS

YIELD (NUCLEAR REACTION)
See NUCLEAR REACTION YIELD

YOLK
See EGGS

YTTERBIUM 156
Effect of nuclear deformation on probabilities of α-, β- and the transitional region $N \simeq 88$. Structure of nuclei in γ-transitions in nuclei with ($N \simeq 88$), 20:22683 (RA;RU)

YTTERBIUM ALLOYS
4f heavy femion photoelectron spectra do not exhibit the Kondo scale, 20:22809 (RA;US)
Fermi surface instability at 0.4K in a heavy-fermion YbBiPt: SDW?, 20:22807 (RA;US)

YTTRIUM ALUMINIUM GARNETS
See ALUMINIUM OXIDES

YTTRIUM OXIDES
Fundamental studies of the mechanism of catalytic reactions with catalysts effective in the gasification of carbon solids and the oxidative coupling of methane. Quarterly report, October 1, 1994–December 31, 1994, 20:20566 (R;US)
Fundamental studies of the mechanism of catalytic reactions with catalysts effective in the gasification of carbon solids and the oxidative coupling of methane. Quarterly report, July 1, 1994–September 30, 1994, 20:20565 (R;US)
Impurities and conductivity in a D-wave superconductor, 20:22836 (RA;US)
Impurities: A smoking gun for the physical origin of high temperature superconductivity, 20:21623 (RA;US)
Origin of 1/f noise peaks of $YBa_2Cu_3O_x$ films in a magnetic field, 20:21611 (R;US)

Site-selective oxygen isotope shift in $YBa_2Cu_3O_7$, 20:22826 (RA;US)
Thin-film electrolytes for reduced temperature solid oxide fuel cells, 20:21451 (R;US)

YUCCA MOUNTAIN
A heated large block test for high level nuclear waste management, 20:20835 (R;US)
A progress report for the large block test of the coupled thermal-mechanical-hydrological-chemical processes, 20:20982 (R;US)
A review of the methods used by the US Environmental Protection Agency to assess the financial impacts of the repository regulations, 20:20819 (R;US)
Bibliography of Yucca Mountain Project (YMP) publications at Lawrence Livermore National Laboratory, September 1977–December 1994, 20:20807 (R;US)
Distribution of potentially hazardous phases in the subsurface at Yucca Mountain, Nevada, 20:20981 (R;US)
Measuring geomechanical properties of Topopah Spring Tuff at the 1-meter scale, 20:20839 (R;US)
Meteorological, stream-discharge, and water-quality data for water year 1992 from two basins in Central Nevada (Yucca Mountain Project), 20:20844 (R;US)
Mined Geologic Disposal System Concept of Operations, 20:20772 (R;US)
Potentially disruptive hydrologic features, events and processes at the Yucca Mountain Site, Nevada, 20:22264 (R;US)
Preliminary evaluation of techniques for transforming regional climate model output to the potential repository site in support of Yucca Mountain future climate synthesis, 20:22242 (R;US)
Progress report on pre-test calculations for the large block test, 20:20831 (R;US)
Radon concentration and working level in the Exploratory Studies Facility (ESF), 20:20997 (R;US)
Yucca Mountain Site Characterization Project Bibliography, July, December 194: An update, 20:20782 (R;US)

Z

Z NEUTRAL BOSONS
CDF results on $Z\gamma$ production, 20:22582 (R;US)

ZEOLITES
See also CLINOPTILOLITE
Computational studies of Bronsted acid sites in zeolites, 20:21699 (R;US)
Effects of soluble organic complexants and their degradation products on the removal of selected radionuclides from high-level waste. Part II: Distributions of Sr, Cs, Tc, and Am onto 32 absorbers from four variations of Hanford tank 101-SY simulant solution, 20:20794 (R;US)
Kinetic measurements on the silicates of the Yucca Mountain potential repository. [Final report], January–September 1994, 20:20797 (R;US)

ZERO POWER REACTORS
See also GODIVA REACTOR
Measurement of β_{eff} and neutron lifetime in fast critical assemblies for transition from BNAB-78 constant system to BNAB-90 one, 20:21220 (R;RU;In Russian)

ZHURAVLEV PROCESS
See COAL GASIFICATION

ZINC
Impurities and conductivity in a D-wave superconductor, 20:22836 (RA;US)

ZINC HALIDE PROCESS
See COAL LIQUEFACTION

ZINC OXIDES
Influence of processing variables on the structure and properties of ZnO films, 20:21628 (R;US)
Novel two-stage selenization methods for fabrication of thin-film CIS cells and submodules. Final subcontract report, March 1, 1993–March 31, 1995, 20:21115 (R;US)

ZINC TELLURIDES
Highly doped p-ZnTe films and quantum well structures grown by nonequilibrium pulsed laser ablation, 20:21646 (R;US)

ZIRCONIUM HYDRIDES
Analysis of energy deposition and evaluation of maximum load of irradiation capsule for NSRR experiment with uranium-zirconium hydride fuel, 20:21285 (R;JP;In Japanese)

ZIRCONIUM OXIDES
Catalyst and process development for synthesis gas conversion to isobutylene. Final report, September 1, 1990–January 31, 1994, 20:20547 (R;US)
Catalyst and process development for synthesis gas conversion to isobutylene. Quarterly report, January 1, 1993–March 31, 1993, 20:20546 (R;US)
Catalyst and process development for synthesis gas conversion to isobutylene. Quarterly report, October 1, 1992–December 31, 1992, 20:20545 (R;US)
Catalyst and process development for synthesis gas conversion to isobutylene. Quarterly report, July 1, 1992–September 30, 1992, 20:20544 (R;US)
Catalysts and process development for synthesis gas conversion to isobutylene. Quarterly report, July 1, 1991–September 30, 1991, 20:20543 (R;US)
Ceramic package fabrication for YMP nuclear waste disposal, 20:20830 (R;US)
Fundamental studies of the mechanism of catalytic reactions with catalysts effective in the gasification of carbon solids and the oxidative coupling of methane. Quarterly report, October 1, 1994–December 31, 1994, 20:20566 (R;US)
Structure and properties of heteroepitaxial $Pb(Zr_{0.35}Ti_{0.65})O_3/SrRuO_3$ multilayer thin films on $SrTiO_3(100)$ prepared by MOCVD and RF sputtering, 20:21609 (R;US)
Thin-film electrolytes for reduced temperature solid oxide fuel cells, 20:21451 (R;US)

Contract Number Index

Numbers assigned to DOE contracts announced in documents in this publication are listed. Contract numbers are sorted alphanumerically and list the primary corporate author of the document cited, the citation number, and the report number or other document identification.

Contract No.	Abstract No.	Report No.

Report Number Index

The report number index consists of the alphanumeric identifiers assigned to report literature as well as patent and conference literature cited in this publication. Entries provide the abstract number; the source(s) of availability of the document; the GPO file prefix for GPO depository library documents; the order number for OSTI and NTIS report ordering purposes; and, if the document was distributed under the DOE distribution program, the category number is shown for paper copy (PC), microfiche (MF), or no distribution (ND). These categories are included to assist DOE librarians in responding to requests for reports in their collections. The index also lists secondary numbers, with the corresponding abstract numbers and cross-references to other identifying numbers.

Report Number	*Abstract Number*	*Source of Availability*	*GPO Dep.*	*Order Number*	*Distribution Category*

ORDER FORM

DOE and DOE Contractors: Fill in Parts I, II, and IV. **Others:** Fill in Parts I, III, and IV. Mark appropriate blanks in Part IV to indicate quantity and form (microfiche or paper copy).

I. SHIPPING AND PAYMENT INFORMATION

Ordering Address

Name _____ Telephone _____

Address _____

City _____ State _____ Zip _____

Shipping Address (if different from above)

Name _____

Address _____

City _____ State _____ Zip _____

_____

SIGNATURE (Required to validate ALL orders)

II. OSTI ORDERS (DOE and DOE contractors can order from OSTI.)

☐ Charge OSTI deposit account no. _____

☐ Charge to my ☐ VISA ☐ Mastercard

_____ _____

Account Number **Card expiration date**

Mail orders to: U.S. Department of Energy
Office of Scientific and Technical Information
P.O. Box 62
Oak Ridge, TN 37831

III. NTIS ORDERS

☐ Charge NTIS deposit account no. _____

☐ Check/Money Order enclosed for $ _____

☐ Charge to my ☐ American Express ☐ VISA ☐ Mastercard

_____ _____

Account Number **Card expiration date**

☐ Ship and Bill (see below for restrictions) _ _ _ _ _ _ _ _ _

Employer identification number (9 digits) —

Purchase Order number _____

Phone number of billing office _____
(Required for Ship & Bill orders)

Ship & Bill service is restricted to North American business locations for an extra $7.50 per order (or per Custom Search). The business' employer identification number plus the phone number of the office paying the bill are required to process these requests. A late payment charge will be applied to billings more than 30 days overdue. Prepaying, using an NTIS Deposit Account or a charge account, speeds order processing. Be sure payment and order are sent together. Checks, payable to NTIS, must be in U.S. dollars.

Mail orders to: U.S. Department of Commerce
Technology Administration
National Technical Information Service
Springfield, VA 22161

IF NO METHOD OF PAYMENT IS INDICATED, YOUR ORDER WILL BE RETURNED TO YOU AS A PRICE QUOTE UNPROCESSED.

IV. SELECTIONS

Order number _____ Report number _____

Abstract number (with vol., issue) _____

No. of fiche _____ No. of paper copies _____

Order number _____ Report number _____

Abstract number (with vol., issue) _____

No. of fiche _____ No. of paper copies _____

Order number _____ Report number _____

Abstract number (with vol., issue) _____

No. of fiche _____ No. of paper copies _____

Order number _____ Report number _____

Abstract number (with vol., issue) _____

Federal Depository Library Program

As a result of an agreement between the U.S. Government Printing Office (GPO) and the Department of Energy, beginning in 1984 DOE reports with unlimited distribution are now included in the Federal Depository Library Program. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and interlibrary loans; however, they are not sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself. Do not send checks or orders to these libraries.
